ABSTRACT

A detailed description of the merged base-year, first and second follow-up data file for the National Longitudinal Study of the High School Class of 1972 (NLS) is presented. This manual documents the contents of the available release tapes so that investigators in the general research community can effectively use these 22,532 records. The records (one for each NLS participant) describe the educational, vocational, and personal development of high school graduates, and the personal, familial, social, institutional, and cultural factors that contribute to that development. The manual has five parts: Introduction, Methodology, File Preparation, Contents and Organization of the Data File, and Technical Specifications. In Part 2, Methodology, the sample design, instruments, and data collection procedures are discussed. Part 3 describes first and second year follow-up data preparation and entry, error and missing data codes, machine editing procedures, and quality and analytic indices. Twenty-three appendices, which include the questionnaires used in the study, lists of data codes and response catgories, and discussions of item weights are also presented. (EVH)

Foreword

The National Longitudinal Study (NLS) of the High School Class of 1972 is a large-scale long-term survey effort supported by the National Center for Education Statistics (NCES), Office of the Assistant Secretary for Education in the Department of Health, Education, and Welfare (DHEW). Broadly stated, NLS is designed to provide statistics on a national sample of students as they move out of the American high school system into the critical years of early adulthood. Data have been gathered and colligated from several sources, coded and edited for analysis purposes, and stored on magnetic computer tapes for future access. The current tapes contain base-year (1972) survey data, collected by the Educational Testing Service, integrated with first follow-up (1973) and second follow-up (1974) survey data, collected by the Research Triangle Institute. This tape package will be augmented periodically as data from subsequent follow-up surveys become available.

The Users Manual provides a detailed description of the merged NLS data file now available for use by the general research community. These data provide an extensive and potentially rich resource for a variety of research purposes. The purpose of this manual is to document the contents of the available tapes, and thereby enable the interested investigator to exploit effectively the research potential of the data.

Obviously, a project of the size and scope of NLS requires the close cooperation and combined effort of many people and organizations. This manual documents an interim release file of those efforts. Finally special note is due thousands of anonymous sample members who have participated in NLS, without whose cooperation the study would not have been possible.

NLS first follow-up activities have been a responsibility of the project codirectors for the contractor, Dr. J. A. Davis and Dr. J. P. Bailey, Jr. Second follow-up activities have been directed by Dr. J. P. Bailey, Jr.

Preface

The merged NLS data file represents a rich and complex source of information. It contains important and timely data of potential use to a broad spectrum of educators, researchers, policy analysts, and decision makers. Preparation of this data file for general use by such a large and diverse set of users was a difficult task. Decisions as to the kind and extent of data editing that needed to be performed were by no means clearcut. In conflict were the need to maintain a faithful record of the original raw data--including respondent errors and inconsistencies--versus the need to provide a straightforward set of data for the typical researcher. The former need was given more importance in the approach to editing this file. That is, it was felt that editing, recoding, imputation, or other data transformation procedures should be minimized, so as to limit tacit assumptions about the respondents or subjective interpretation of the data that would be required for these procedures. Any imputations or modification of the original data might be considered "biased" by other investigators. Where imputations are concerned, researchers should be free to set data standards in accordance with their specific needs. Thus, the data transformation procedures that were used were directed toward making the data available in a consistent and useful format that would preserve as accurately as possible the original responses of the study participants.

The file processing that was performed involved extensive verification, cleaning, and supplementary coding of the original data. Editing transformations were limited to verifying that respondents followed the written instructions and routing patterns in the questionnaire. If either type of instruction was violated, then supplementary codes were inserted in the data to indicate the location and nature of the violation. The extent and details of the editing are the subject of this manual.

It would have been possible to provide another level of editing. Responses could have been edited with respect to the content of the question and with respect to the interrelations of sets of questions. But this kind of editing requires some guidelines and is usually directed by the particular set of hypotheses one wishes to investigate. Since the data file is designed for such a broad range of investigators, and in the interest of timeliness, it was decided that any further editing must be left to the discretion of the analyst. This decision creates some additional work for the user, but it allows full access to all the original detail in the data file. No analyses have been prohibited by preprocessing or prior summarization of the data.

The decision to produce the data file in this format places some additional responsiblity on the user. Since little simplification of the data has been done, the analyst must exercise care in using the data file. The NLS data base is large and complex. The routing patterns in the instruments and the fact that data have been collected at different points in time require that the analyst view the data base holistically. Many of the individual items are not well suited to independent analysis. Moreover, it is necessary to consider the interdependent nature of such items and to study the patterns of response to those items.

Given consideration of these cautions and careful study of the documentation provided in this manual, the NLS data file will serve as the rich source of information that it was designed to provide.

The authors wish to thank all those people who have contributed to the production of this manual. Special thanks are due to RTI's Computer Application Center and Survey Operations Center for their efforts in computer processing and data collection. Several parts of this manual are based on technical reports dealing with the NLS data. Users are encouraged to consult these reports for detailed exposition of specific topics. In addition, grateful acknowledgment is due to Mrs. Linda Hoffmann for her excellent and patient assistance in the preparation of this manual. Finally, acknowledgment is due for the considerable input of Dr. Kenneth Tabler, NCES project officer for NLS first follow-up activities, and Mr. Elmer Collins, NCES project officer for NLS second follow-up activities.

Part 1: Introduction

In 1968 the National Center for Education Statistics (NCES) conducted a survey to determine the specific data needs of educational policymakers and researchers. Respondents to the survey expressed a need for data that would allow comparisons of student educational and vocational experiences with later outcomes. This finding provided the impetus for NCES to begin planning for the first of an intended series of national longitudinal studies.

In April 1970 a number of prominent educational researchers and administrators met with interested Federal officials in Washington, D. C. The National Longitudinal Study of the High School Class of 1972 (NLS) reflects their guidance and the interests and data needs of a number of United States Office of Education (USOE) agencies: the Office of Planning, Budgeting, and Evaluation; the Bureau of Postsecondary Education; the Bureau of Occupational and Adult Education; the Bureau of Programs for the Handicapped; as well as the National Center for Education Statistics. Four advisory committees provided guidance in the planning and implementation of the survey. One committee was composed of research experts and representatives of various educational organizations; two others were made up of officials of state education agencies; and the fourth, an internal USOE users committee, represented the data needs of the various offices and bureaus of the U. S. Department of Health, Education, and Welfare (DHEW).

The primary purpose of NLS is the observation of the educational and vocational activities, plans, aspirations, and attitudes of young people after they leave high school and the investigation of the relationships of this information to their prior educational experiences, personal, and biographical characteristics. Ultimately, the study will allow a better understanding of the development of students as they pass through the American educational system and of the complex factors associated with individual educational and career outcomes. Such information is essential as a basis for effective planning, implementation, and evaluation of Federal policies and programs designed to enhance educational opportunity and achievement and to upgrade occupational attainments and career outcomes.

Following a rather extensive period of planning, which included the design and field test of survey instrumentation and procedures, the full-scale survey was initiated in the spring of 1972. The target survey population consisted of a national probability sample of 21,600 students from 1,200 high schools. A total of 18,143 seniors from 1,070 public, private, and church-affiliated high schools participated in the base-year survey.

The first follow-up data collection effort was begun in October 1973 and was completed in April 1974. In the sample of 22,654 young adults who were expected to participate, 94.2 percent (21,350) completed the first follow-up instrument--65.7 percent (14,019) by mail and 34.3 percent (7,331) by personal interview. Participants were asked where they were in October 1973 and what they were doing with regard to work, education, and/or training. Similar information was requested for the same time period in 1972 to facilitate tracing of progress since leaving high school and to define the factors that affect that progress.

Second follow-up data collection began in October 1974 and was completed by April 1975. In October, survey operations were initiated for 22,364 sample members. By April 1975, 20,872 instruments had been completed; 72.1 percent (15,058) by mail and 27.9 percent (5,814) by personal interview. The second follow-up data collection efforts resulted in a completion rate of 93.3 percent of those expected to complete the instrument.

Current planning calls for at least two more follow-up surveys in the National Longitudinal Study of the High School Class of 1972 in the next few years. The potential uses for the information being gathered by these studies are legion; the broad data base and succession of observed effects will fill a widespread need on the part of educational researchers and administrators for information on the flow of young adults through the postsecondary occupational-educational system. They will provide insight for identifying and understanding the major branching or decision points that affect the educational and life patterns of individuals in the period following secondary school. Important linkages or path choices can be traced; estimates of the associated transition probabilities can be provided; and insight into the relative importance of the factors which determine or otherwise affect these transition probabilities can be obtained.

Part 2: Methodology

I. THE SAMPLE

A. Sample Design

The sample design may be described as a deeply stratified two-stage probability sample with schools as first-stage sampling units and students as second-stage units. The population consisted of all 1972 twelfth graders enrolled in all public, private, and church-affiliated high schools in the 50 States and the District of Columbia. The first-stage sampling frame was constructed from computerized school files maintained by USOE and by the National Catholic Education Association.

The school sampling frame was stratified into 600 final strata based on the following variables:

- Type of control (public or nonpublic),
- Geographic region (Northeast, North Central, South, and West),
- Grade 12 enrollment (less than 300; 300 to 599; 600 or more),
- Proximity to institutions of higher learning,
- Percentage minority group enrollment,
- Income level of the community, and
- Degree of urbanization.

In order to increase the numbers of disadvantaged students in the sample, schools located in low-income areas and schools with high proportions of minority group enrollments were sampled at approximately twice the sampling rate used for the remaining schools. Schools in the smallest grade 12 enrollment strata (less than 300 seniors) were selected with probabilities proportional to their estimated numbers of senior students and without replacement. Schools in the remaining strata were selected with equal probabilities and without replacement. In each final stratum, four schools were selected initially and then two of the four were randomly selected and designated as the primary selections. The other two schools were retained as backup or substitute selections and were to be used in the sample only if one or both of the primary schools did not cooperate (e.g., refused, ineligible). Samples of 18 students per school were selected and five additional students were selected as alternates. The students were sampled with equal probabilities and without replacement within schools.

B. School Response Data

The sample design involved 1,200 primary sample schools and 21,600 students (18 per school). Of the 1,200 primary sample schools, 948 participated in the base-year survey, 21 had no senior students enrolled, and 231 either refused to participate or could not participate due to the fact that the request was received too late in the school year (see Table 1).

Table 1

RESPONSE STATUS OF PRIMARY SAMPLE SCHOOLS

Item	Base-Year Survey	First Follow-Up Survey	Second Follow-Up Survey
Participants	948	1,153	1,153
No Senior Students	21	21	21
Nonparticipants	231	26	26
Total	1,200	1,200	1,200

Due to the large school nonresponse in the base-year survey, further attempts were made to secure participation of the 231 nonparticipant primary sample schools and replacements for the 21 schools that had no seniors. This "resurvey" activity, initiated by NCES prior to the first follow-up survey, involved securing school cooperation and selecting random samples of up to 18 former students (1972 seniors) per school. The "resurvey" activities were successful in 205 of the 231 primary sample schools; thus, students from 1,153 of the 1,200 primary sample schools were included in the first follow-up survey (Table 1).

Students selected from backup or substitute schools were also included in the base-year, first follow-up, and second follow-up surveys.

In the base-year survey, 122 backup schools participated--including 26 schools which were "extra" in their final stratum. A backup school was termed "extra" if both primary sample schools from that stratum participated. Students from the 26 "extra" schools were not included in the first follow-up survey, but additional backup schools were included so as to obtain at least two participating schools in the first follow-up survey from each of the 600 final strata. In the second follow-up survey 18 of the "extra" schools were used to include cases with complete base-year data.

Samples of former 1972 senior students were also selected from 16 sample augmentation schools; these schools were selected from those identified in 200 sample school districts canvassed to identify public schools not included in the school sampling frame. Samples of students selected from the 16 augmentation schools were not included in the base-year survey but were included on subsequent surveys.

In summary, data were collected from students representing 1,070 participating schools in the base-year survey, 1,300 schools in the first follow-up survey, and 1,318 schools in the second follow-up survey (see Table 2).[*]

C. Weight Calculations

Unadjusted student weights were calculated as the inverses of sample inclusion probabilities for all students sampled. A weighting-class method was used to calculate several sets of nonresponse adjusted weights. The methodology and use of the various weights are described in the paragraphs which follow.

1. Unadjusted Student Weights

First, it was necessary to determine exactly which sample schools and students were to be considered "in sample" cases for the 1972 NLS project. The sample design involved 1,200 primary sample schools (two per final stratum) and 21,600 students (18 per school). However, the use of backup schools in the base-year and first follow-up surveys, the use of "extra" schools in the second follow-up survey, plus the resurvey work to obtain responses from all of the primary sample schools, resulted in three or four schools being represented in many final strata. After considering the alternatives, it was decided that all sample schools from which student questionnaires were completed would be considered to be in the NLS sample. A total of 1,339 schools were classified as "in the final NLS sample"--1,153 participating primary sample schools, 21 primary sample schools with no 1972 seniors, 131 backup sample schools, 18 "extra" base-year schools in which student questionnaires were completed, and 16 augmentation sample schools. It would have been possible to reduce the sample of schools to the 1,200 originally intended, but this alternative was not exercised since considerable base-year student data would have been discarded with this alternative. The release files contain data for students representing 1,318 schools--all of the 1,339 schools in the final NLS sample except the 21 primary sample schools with no 1972 seniors (see Table 2).

For each school in the original 600 final strata, the sample inclusion probability, P_{hi}, was calculated as

$$P_{hi} = n_h\left(\frac{A_{hi}}{A_h}\right)$$

where n_h = number of schools in the final NLS sample for stratum-h,

A_{hi} = size measure for school-i of stratum-h,

and A_h = sum of size measures for all schools in stratum-h.

For schools in the smallest size strata, those with less than 300 seniors, the size measure for a school was the estimated number of seniors in the school or 18, whichever was larger. For schools in the two larger size strata, the size measure for each school was equal to one. Thus, schools in the smallest size strata were selected with probabilities proportional to the number of seniors, and schools in the two larger size strata were selected with equal probabilities.

A sample of 200 school districts was canvassed during the base-year to identify public schools which were not in the sampling frame. A total of 45 such schools were identified and 23 of them were randomly selected as an augmentation sample.* School selection probabilities, P_i, were calculated for each of the 45 schools, as suggested by the NLS sampling contractor.** The 16 participating augmentation schools were grouped into strata (h = 601, 602, ..., 608); sample inclusion probabilities, adjusted for school nonresponse, for these 16 schools were calculated as

$$P_{hi} = \left(\frac{16}{23}\right)\left(\frac{1}{2}\right) P_i \quad .$$

The number of students in the sample from each sample school was taken as the number of students who were offered a chance to be in the sample and who also were eligible. This included all sample eligibles, both respondents and nonrespondents, but excluded selected students who were not eligible for the study--such as dropouts, early graduates, and adult education students.

**"Sample Design for the Selection of a Sample of Schools with Twelfth-Graders for a Longitudinal Study," Westat, Inc., Rockville, Maryland, June 1971.

There were 23,451 sample students. The unadjusted student weight, W_{uhij}, for each of the 23,451 selected students was calculated as

$$W_{uhij} = \frac{1}{P_{hi}} \cdot \frac{N_{hi}}{n_{hi}} ,$$

where N_{hi} = number of senior students in school-hi,
and n_{hi} = number of sampled students in school-hi.

The sum of the unadjusted student weights is an estimate of the total number of 1972 high school seniors in the population; if all of the selected students had completed the survey instruments, these weights would be appropriate for the analyses of student data.

2. Nonresponse Adjustments in the First Follow-Up

The problem of nonresponse when analyzing survey data remains an open question. In general, the mean values of most variables will be different for respondents and nonrespondents. If the differences are large or if the survey response rates are low, then appropriate nonresponse adjustments are used in an attempt to reduce the bias due to nonresponse. There are no methods of adjusting for nonresponse that are known to be unbiased or even consistent.[*] Various methods of imputing or attempting to correct for both item nonresponse and for total questionnaire response are summarized in a paper by Chapman.[**]

After considering various methods of adjusting for questionnaire nonresponse, a weighting-class procedure[***] was used. (No adjustments were made for item nonreponse within completed questionnaires.) The adjustment involves partitioning the entire student sample of respondents and nonrespondents into weighting classes, which are homogeneous groups of students with respect to the survey classification variables. Differential response rates for students in different weighting classes are reflected in the adjustment.

[***] Westat, Inc. Computation of Weights for Respondents to the 1971 Follow-Up Survey of 1967 College Freshmen. Report to the U.S. Office of Education, July 15, 1973.

The classifier variables used to define weighting classes were:

Race--white or nonwhite;
Sex--male or female;
High school curriculum--general, academic, or
    vocational-technical;
High school grades--B or better, or C or below; and
Parents' education--less than high school graduate,
    high school graduate, some beyond high school,
    or college graduate.

NLS Student's School Record Information Forms (SRIF's), base-year Student Questionnaires, and First Follow-Up Questionnaires were all used as potential sources for the values of the first follow-up classifier variables. In addition, the sex variable was inferred from the student names when no other information was available. Values for all five classifier variables were determined for over 84 percent of the 23,451 sample students and at least three of the classifier variable values were determined for 95 percent of the sample students. The most frequent value of the classifier variable was imputed, for weighting purposes, for missing values.

The crossing of the five classifier variables yielded a table with 96 cells (2 x 2 x 3 x 2 x 4). Cells with fewer than 20 respondents were combined with similar cells to obtain a total of 87 weighting classes.* The nonresponse adjustment procedure, applied within each weighting class, involved dividing the respondents' unadjusted weights by the weighted response rate for the weighting class. Actually, several sets of adjusted weights were calculated--each set is appropriate for particular analyses. The next sections contain the weight adjustment formulae and a description of the sets of adjusted student weights for the first and second follow-up surveys.

---

*Appendix L lists the values of the classifiers for the 87 weighting classes.

3. First Follow-Up Adjusted Student Weights

Six different sets of adjusted student weights were calculated; each set is appropriate for analyses involving a particular data set.

Table 3 lists the data set and variables appropriate to each set of weights--W1, W2, W3, W4, W5, and W6. Also listed in Table 3 is W7, the raw unadjusted weight which formed the base for the various adjusted weights. Table 4 shows the number of sample students in each of five response groups, determined by which questionnaires the students completed. From Table 4, one can see that 16,683 (response groups I and II) students completed the base-year Student Questionnaire. However, limited base-year data were also collected during the first follow-up survey from some additional sample students who had not completed the base-year Student Questionnaires. Thus, data for base-year items 2, 5, 8, 10, 16, 27, 83, 84, 88, 91, 92, 93, 94, and 95 (included on Form B, First Follow-Up Questionnaire) were obtained from 21,222 students (response groups I, II, and IV). Two sets of nonresponse adjusted student weights were computed for analyses of base-year data. Analyses of the 14 base-year items listed above should be based upon the W2 weights. For all other base-year questionnaire items, the W1 weights should be used.

There was a total of 21,350 respondents to the First Follow-Up Questionnaire (response groups I, III, and IV). The W3 weights are appropriate for analyses of first follow-up questionnaire items.

Analyses of change, or transition, variables derived using both base-year and first follow-up items should be carried out using either the W4 or W5 weights. If the change variables are defined using base-year items 2, 5, 8, 10, 16, 27, 83, 84, 88, 91, 92, 93, 94, and 95, then the W5 weights are appropriate. For

V	no	no	no	1,053**
TOTAL				23,451

*In this group of students, 415 completed a Form B Questionnaire that was used in a reliability study (see N. I. Lyons and R. P. Moore, National Longitudinal Study of the High School Class of 1972, Technical Report: Reliability of Retrospective Data, Research Triangle Institute, Research Triangle Park, North Carolina, March 1976). These Form B data were not used in preparing the release files.

**These students did not respond to either the base-year or first follow-up instrument, but may have responded to some other instrument; i.e., Test Book, Student Record Information Form, Second Follow-Up Questionnaire.

analyses of change variables based on other base-year items in conjunction with first follow-up items, the W4 weights should be used. From Table 4, one can see that matched base-year and first follow-up data are available for 15,635 students (response group I) for most variables and for 20,174 students (response groups I and IV) for the 14 base-year variables listed above.

The last set of weights (W6) is appropriate for analyses involving students in response groups I, II, III, and IV. There are 22,398 students in this group--one for each student who completed a base-year Student Questionnaire and/or a First Follow-Up Questionnaire. The remaining 1,053 sample members (response group V) did not complete either questionnaire.

For each weight set, the adjusted weights for nonrespondents are zero and the sum of the respondents' adjusted weights equals the sum of the unadjusted weights for the entire sample. The user should choose the set of adjusted weights which is appropriate to the data set and variables to be analyzed. As mentioned previously, the weights are adjusted only for questionnaire nonresponse and not for item nonresponse. The same methods could be used to obtain another set of weights, adjusted for both questionnaire nonresponse and item nonresponse, for any questionnire item or variable. In most cases, the gains from such an adjustment would not be expected to outweigh the additional cost.

The weight adjustment formulae are shown below. First, define

$$K_{hij} = \begin{cases} 1 \text{ if student-hij belongs to weighting class-k, or} \\ 0 \text{ otherwise;} \end{cases}$$

and

$$L_{hij} = \begin{cases} 1 \text{ if student-hij completed the questionnaire(s) required to be included in data set-}\ell\text{, or} \\ 0 \text{ otherwise;} \end{cases}$$

and W_{uhij}, the unadjusted student weight, described earlier. The nonresponse adjusted weights, $W_{hij(k)\ell}$, for data set-ℓ were computed as

$$W_{hij(k)\ell} = W_{uhij} \, L_{hij} \, \frac{\sum_{hij} K_{hij} \, W_{uhij}}{\sum_{hij} K_{hij} \, L_{hij} \, W_{uhij}} ,$$

for student-j who was selected from school-hi and classified in weighting class-k (k = 1, 2, ..., 87).*

4. Second Follow-Up Nonresponse Adjustments

The nonresponse adjustments for the second follow-up survey were similar to those done for the first follow-up. The same core of unadjusted weights for the entire NLS sample (23,451 sample members) was used. Two minor changes in procedure were introduced concerning redefinition of the classifiers using updated information and allocation of unclassifiable sample members. The procedures incorporating the above changes are briefly described below.**

5. Assembling Classifier Variable Data

The same first follow-up classifier variables were used in defining the second follow-up weighting classes. After several years of survey activity, there were several response sources for each of the classifier variables. The following sources were used in the order indicated:

Race

(1) Base-year Student Questionnaire (Q84)
(2) First Follow-Up Questionnaire Form B (Q95)
(3) Second Follow-Up Questionnaire (Q28)

Sex

(1) Base-year Student Questionnaire (page 1)
(2) First Follow-Up Questionnaire
(3) Inferred from name on student rosters
(4) Second Follow-Up Questionnaire (inside back cover)

*A more detailed discussion of the weight calculations is covered in a separate technical report; see R. Paul Moore, Calculation on Nonresponse-Adjusted Student Weights for Respondents to the NLS Base Year and First Follow-Up Surveys, Statistics Research Division, Research Triangle Institute, Research Triangle Park, North Carolina, October 1975.

6. Forming the Weighting Classes

The next step was to cross-classify the 23,451 sample students by the values of the five classifier variables. Since an "unavailable" category had been added to each classifier variable, a total of 540 cells (3 x 3 x 4 x 3 x 5) was produced, with counts of sample students and responding students for each cell. (Several respondent counts were made since several different adjusted weights were to be calculated--see next section).

An arbitrary rule that each weighting class must contain at least twenty respondents was used to avoid any very large weight adjustments. A set of collapsing rules had been predetermined for use in combining "similar" cells which contained fewer than 20 respondents. Cells were combined in the following order until each of the combined cells contained at least 20 respondents:

(1) Add "unavailables" randomly to known category of each variable in proportion to marginal weight totals for each known category.

(2) Change curriculum to two levels:
    (a) Add "general" to "vocational-technical"
(3) Change father's education to two levels:
    (a) Add "less than H.S." to "H.S. graduate"
    (b) Add "some beyond H.S." to "H.S. graduate"
(4) Eliminate grades.
(5) Eliminate curriculum.
(6) Eliminate father's education.
(7) Eliminate sex.
(8) Eliminate race.

It turned out that virtually all of the cells involving one or more "unavailable" classifier variables had fewer than 20 responding students. Because of this, the combinations specified in step 1 above were done for all of those cells. Step 2 was used seven times and step 3 was used two times. The remaining steps, 4 through 8, were never used.

A total of 87 weighting classes were formed using the procedures described in this section. Each weighting class contained 20 or more respondents for each of the data sets described in the next section.

7. Calculating Adjusted Student Weights for Second Follow-Up

Once the weighting classes had been determined, the adjusted student weights were computed using the equation given in Section 3 above. Since several different data sets could be derived from the NLS base-year, first follow-up, and second follow-up data base, a total of five different sets of adjusted weights were computed.

Table 5 lists the data set and variables appropriate to each set of weights--W8, W9, W10, W11, and W12. Table 6 shows the number of sample students in each of the eight response groups, determined by which questionnaires the students completed.

There was a total of 21,350 respondents to the First Follow-Up Questionnaire, and 20,872 respondents (see Table 6) to the Second Follow-Up Questionnaire. The weight W8 is appropriate for analysis of items in the Second Follow-Up Questionnaire.

*These students did not respond to either the base-year, first follow-up, or second follow-up instrument, but may have responded to the Test Book and/or the Student Record Information Form.

Analyses of change, or transition, variables derived using both base-year and second follow-up items should be carried out using the W9 weights. For analyses of change variables based on second follow-up items in conjunction with first follow-up items, the W10 weights should be used. The W11 weights should be used for combined analysis of items across all three questionnaires.

The last set of weights, W12, is appropriate for analyses involving every student who completed a base-year Student Questionnaire, and/or a First Follow-Up Questionnaire and/or a Second Follow-Up Questionnaire.

For each weight set, the adjusted weights for nonrespondents are zero, and the sum of the respondents' adjusted weights equals the sum of the unadjusted weights for the entire sample. The user should choose the set of adjusted weights which is appropriate to the data set and variables to be analyzed. The weights are adjusted only for questionnaire nonresponse and not for item nonresponse. The same methods could be used to obtain another set of weights, adjusted for both questionnaire nonresponse and item nonresponse, for any questionnaire item or variable.

II. INSTRUMENTS

A. Base-Year Instrumentation*

Each student in the sample was asked to complete applicable portions of a Student Questionnaire containing 104 questions distributed over 11 major sections. The base-year Student Questionnaire dealt with factors related to the student's personal-family background, educational and work experiences, plans, aspirations, attitudes, and opinions. Students were given the option of completing the questionnaire in school or taking it home and answering the questions with the assistance of their parents.

In addition to the Student Questionnaire, each student was asked to complete a 69-minute Test Book measuring both verbal and nonverbal ability. The Test Book consisted of six tests, which are described briefly below in the sequential order of administration.

---

*The administration and processing of the base-year instrumentation is described in "The Base-Year Survey of the National Longitudinal Study of the High School Class of 1972--Final Report," ETS, Princeton, N. J., June 1973.

1. Vocabulary. A brief test using synonym format. The items were selected to avoid academic or collegiate bias and to be of an appropriate level of difficulty for the twelfth grade population. (15 items, 5 minutes)
2. Picture Number. A test of associative memory consisting of a series of drawings of familiar objects, each paired with a number. The student, after studying the picture number pairs, is asked to recall the number associated with each object. (30 items, 10 minutes)
3. Reading. A test based on short passages (100-200 words) with several related questions concerning a variety of reading skills (analysis, interpretation) but focused on straightforward comprehension. In combination with the vocabulary test, it provides a means to derive a verbal score which can allow links to the normative data available for SAT. (20 items, 15 minutes.)
4. Letter Groups. A test of inductive reasoning requiring the student to draw general concepts from sets of data or to form and try out hypotheses in a nonverbal context. The items consist of five groups of letters among which four groups share a common characteristic while the fifth group is different. The student indicates which group differs from the others. (25 items, 15 minutes)
5. Mathematics. Quantitative comparisons in which the student indicates which of two quantities is greater, or asserts their equality or the lack of sufficient data to determine which quantity is greater. This type of item is relatively quickly answered and provides measurement of basic competence in mathematics. (25 items, 15 minutes)
6. Mosaic Comparisons. A test which measures perceptual speed and accuracy through items which require that small differences be detected between pairs of otherwise identical mosaics or

tile-like patterns. A deliberately speeded test, it has three separately timed sections consisting of increasingly more complex mosaic patterns. (116 items, 9 minutes)

Base-year data were also obtained from a Student's School Record Information Form (SRIF). Items on the SRIF pertained to the student's high school curriculum, grade point average, credit hours in major courses, and, if applicable, his or her position in ability groupings, remedial-instruction record, involvement in certain federally supported programs, and scores on standardized tests.

Finally, information from a School Questionnaire and one or two Counselor Questionnaires were also obtained for each participating high school. Counselor Questionnaires were not obtained from schools involved in the "resurvey" activity.

B. First Follow-Up Instrumentation

Two forms (A and B) of a First Follow-Up Questionnaire were developed and designed for self-administration by the student. Form A was mailed to each sample member who responded to the base-year Student Questionnaire. Seniors from the high school class of 1972 who were unable to participate in the base-year survey (usually because of time and scheduling considerations) were mailed Form B of the questionnaire. Questions one through 85 were identical on both questionnaire forms. The questionnaire was organized into sections. Form A contained five sections: General, Education and Training, Work Experience, Military Service, and Background Information. These questions dealt with information concerning the respondent's activity state (education, work, etc.) in October 1972 and October 1973; his or her socioeconomic status; work and educational experiences since leaving high school; and future educational and career plans, aspirations, and expectations. Form B of the First Follow-Up Questionnaire contained an additional 14 questions to supplement missing base-year information (see Table 14, p. 66).

C. Second Follow-Up Instrumentation

The Second Follow-Up Questionnaire is similar in format to the first follow-up. It contains over 153 questions arranged in seven sections--General, Education and Training, Work, Family, Military, Activities and Opinions, and Background Information. The instrument collects updated information concerning the activity status of NLS sample members as of fall 1974. In addition to activity states, information concerning family status, personal attitudes, opinions, and plans were obtained. As was the case in the first follow-up, most of the instrument items are forced-choice format. Open-ended, or free-response, questions were limited to questions involving dates, income, number of hours or weeks worked, and the like. Copies of all the instruments are provided in Appendix A.

III. DATA COLLECTION PROCEDURES

A. Base-Year Data Collection

In the base-year survey, 1,070 schools were able to participate. The resulting student sample of 19,155[*] produced varying response rates for each of the data collection instruments. The bulk of the student data was collected in April, May, and June of 1972 through group administration in each school. Survey administrators completed School Record Information Forms for each participating student, plus approximately 1,000 additional students during the summer of 1972. It was intended that these additional students, who did not complete the Student Questionnaire in spring 1972, would be sent Form B of the First Follow-Up Questionniare to obtain some base-year student information from the respondents.

B. First Follow-Up Data Collection

The first step in data collection for first follow-up involved an extensive tracing operation to update name and address files. The Research Triangle Institute received from the previous contractor a name and address file from the base-year survey. This file contained 19,155 records; a total of 18,683[**] of these individuals from 1,044 schools was used for the first follow-up survey. In addition, 256 resurvey schools with 4,439* individuals were added to the base-year lists. A newsletter was developed and mailed in July 1973 not only to encourage participation but also to use as a vehicle for updating names and addresses. When mail was returned by the U. S. Postal Service as undeliverable, telephone tracing procedures were used to obtain current addresses where possible.

---

[*] 18,683 from primary and other schools, 472 from "extra" schools.

[**] The 472 additional individuals from 26 "extra" schools were excluded from the first follow-up survey.

Prior to the mailout of the First Follow-Up Questionnaires, 468 individuals were deleted from the mailout list for operational reasons (e.g., duplicate names, inaccurate addresses, deceased), yielding a target survey sample of 22,654.

Questionnaires were mailed to the last known addresses of the resulting sample on 23-24 October 1973. This mailout was followed by a planned sequence of reminder postcards, additional questionnaire mailings, and reminder mailgrams to nonrespondents. Active mail return efforts continued through December 1973; by early February 1974, the questionnaire return rate by mail was 61.5 percent.

The names and addresses of those sample members who failed to mail back their questionnaires were then turned over to the Bureau of the Census for personal interviews in accordance with a Bureau arrangement with the U. S. Office of Education. This personal interview phase of first follow-up data collection continued until April 7, 1974, at which time the overall response rate had been increased to 94.2 percent--21,350 respondents out of 22,654. If one considers the total number of students surveyed in the first follow-up, the response rate is 91.0 percent or 21,350 out of 23,451.

C. Second Follow-Up Data Collection

The core of 23,451 NLS sample members served as a base for second follow-up data collection activities. Those available for second follow-up are this base minus several categories of respondents who were unavailable for survey.* These categories included refusals obtained in the base year and first follow-up surveys (students who stated they were unwilling to participate in the study), ineligibles (out of the country, institutionalized, deceased, mentally retarded, etc.), and no address (respondents who were untraceable as of fall 1974). This left for survey in the second follow-up 22,364** sample members. Data collection activities took place from July 1974 through June 1975. Survey activities included the mailout of newsletters to sample members, telephone tracing of those individuals whose newsletters and/or questionnaires were returned as undeliverable, mailing of letters to parents of respondents to advise them of their child's involvement in the study, questionnaire and postcard mailouts, mailgram and telephone contacts with nonrespondents at predetermined intervals, and field interviews with nonrespondents to mail efforts. Data collection for a reliability study was also conducted concurrently by both mail survey procedures and personal interviews with a subsample of 600 study members. A total of 20,872 Second Follow-Up Questionnaires were completed--15,058 by mail and 5,814 by personal interview. The response rates can be computed in two ways; one using the total sample (23,451) and the other using the second follow-up target (22,364). The two overall response rates are 89.0 percent and 93.3 percent respectively.

---

*A list of resurvey students was provided by USOE.

Concurrent with second follow-up data collection activities, a special survey operation was also undertaken. This survey, the special activity state survey, was initiated in response to analysis of base-year and first follow-up data. As the first follow-up data were being analyzed during the summer and fall of 1974, it became evident that about 3,100 respondents could not be classified into an activity state for October 1972; over 2,400 could not be classified for October 1974;

---

*A more detailed presentation of the data collection activities is available in D. A. King, M. F. Weeks, N. R. Thorne, and C. S. Myers, National Longitudinal Study of the High School Class of 1972 Data Collection Activities for the Second Follow-Up (August 1974 through June 1975), Research Triangle Institute, July 1975.

**This figure includes 329 base-year "extras." These were base-year respondents from backup schools who were to be included in the NLS second follow-up effort in January 1975 and were scheduled for personal interview in the second follow-up survey.

and over 3,500 could not be classified into the activity state transition matrices. The unclassifiables appeared to be more heavily represented by low SES and low aptitude respondents, thus introducing a potential bias for certain analyses. It was decided to conduct a special activity state survey to collect necessary missing data.*

It was noted and emphasized, at the time, that second follow-up activities currently underway with the NLS sample could be used to substantially reduce the costs of the special survey. Data could be gathered by telephone or by personal interviews. Telephone calls were in process for Second Follow-Up Questionnaires that had failed the edit checks, and an additional few questions could be added to the already scheduled calls. Similarly, field interviewers would begin contacting second follow-up mail nonrespondents in early January 1975, and questions could be added. Final identification was made of all respondents who required additional contact, questions were selected and approved by NCES, and preparations were made to collect the additional data.

The number of respondents to be recontacted was determined to be 3,904, among whom 218 have since been removed from active NLS participation. The remaining 3,686 respondents to be contacted were in the following second follow-up status:

(a) 1,580 nonrespondents, subject to field interview;
(b) 739 fail-edit, subject to telephone call;
(c) 1,367 passed edit, in process or in transit, subject to special telephone call.

The supplementary information questionnaire contained only questions which had previously been asked as a part of the NLS first follow-up survey (see Appendix A). It was not self-administered; only field interviewers or telephone interviewers administered the instrument. All questions were asked of all target respondents.

A total of 3,088 Activity State Questionnaires (ASQ) were completed, a completion rate of 83.8 percent. The RTI staff was unable to contact or get cooperation from 518 people scheduled for the ASQ. The activity state survey data were treated as a separate entity in data processing. Separate coding and keying operations were designed for this survey instrument. Two pre-keying operations were required to code postsecondary schools and father's occupation.

---

*A more detailed discussion of this survey is available in King et al., as cited on the preceding page, and also in J. R. Levinsohn, National Longitudinal Study of the High School Class of 1972: Special Activity State Survey and Second Level of Edit Activities, Research Triangle Institute, March 1976.

From the point of view of requirements for computer support, the special activity state survey was a new survey. As supplementary data were received, they were separated from the second follow-up data they accompanied and were processed as completely independent questionnaires. The ASQ forms were computer edited for valid ranges. Since all forms were administered either by telephone or personal interview, skip pattern violations were not a problem. The resulting edited file served as the data base to update all 1972 and 1973 activity states and compute various composite values (father's education, high school program, mother's and father's education level). Since the ASQ survey was an additional survey, at a point in time one or two years removed from the initial surveys, the ASQ data were not used to replace corresponding base-year or first follow-up items. This information was used solely to compute updated activity states or updated composites which are distinct variables in the release file.

Part 3: File Preparation

I. FIRST FOLLOW-UP DATA PREPARATION AND ENTRY[*]

Questionnaires returned by mail, either from individual sample members or from Bureau of the Census interviewers, were routed on a flow basis to a central check-in point for initial processing. Each respondent's six-digit ID number and batch number were noted and transmitted to the data processing section for entry into an automated survey support system so that a daily count could be maintained on the number of questionnaires already received and inhouse. Batches were then routed to the pre-machine (manual) editing section where certain checks were made to ascertain if each questionnaire contained a minimum set of "critical" data.[**] Questionnaires which passed this manual edit stage were then transmitted to the direct data entry section to be transformed into machine readable form. Those questionnaires which failed the manual edit procedures were routed to the telephone follow-up section where contact was made with the respondent to resolve problems uncovered in manual edit. After resolution, these questionnaires were also transmitted to the direct data entry section for encoding. After data entry operations, questionnaires were placed in temporary secure storage prior to microfilming and eventual destruction. At each phase of the document flow, appropriate event entries were made to the automated survey support system so that there could be constant monitoring of the location of all questionnaires in the document flow process.

A. Manual Pre-Machine Editing

The general approach considered in the pre-machine editing centered around the following ideas: if basic "key" questions were answered, or could be presumed by responses to other related items, then a questionnaire would be accepted--no matter how little other information was given; however, if any "key" information were missing, a telephone call to the respondent would be made to get these priority data.

---

[*] Base-year data preparation procedures are documented in the ETS final report referenced earlier.

[**] Appendix B lists the items that were considered critical.

The priority, or key, items covered the following areas:

1. Current activity,
2. Activity expectations for October 1974,
3. Training programs since high school,
4. College or university attendance since high school,
5. Classes or courses since high school,
6. Job in October 1973,
7. Job in October 1972,
8. Selected work history items since high school,
9. Armed Forces service, and
10. Background (tracing) information such as name, address, and telephone number of respondent and next of kin, and date of birth, sex, and social security number.

B. Manual Coding

Manual recoding of alphabetic information into numeric form was performed in a few areas of the questionnaire prior to transformation into machine-readable form. Two questions (49A, 55A) concerning a job area or occupation for 1972 and 1973 were recoded into the corresponding three-digit code specified in the Census Index of Industries and Occupations. In addition, the parental occupation question (79) was also coded in the same manner. The complete three-digit occupational classification scheme is presented in Appendix C.

The other major area involving recoding of alphabetic data concerned school information. Postsecondary school identification, whether of the college or university type or of the vocational-technical type, was coded into six-digit U. S. Office of Education vendor or FICE codes, using a master index provided by OE.* Fields of study (questions 22B, 26A, 36A, 60B) reported by respondents who attended school during the post-high-school period were recoded into HEGIS categories, using both the four-digit academic subdivisions of knowledge and training provided by the HEGIS Taxonomy* (Academic Subdivisions) and the six-digit HEGIS technological and occupational schemes. (See Appendix D.1 for listing of six-digit field of study codes.) Finally, the responses to question 43B were coded numerically to indicate type of license, certificate, or diploma. These codes are listed in Appendix D.2.

---

*School names and FICE codes have been withheld in order to protect the confidentiality of respondents.

There were 18 questions in the First Follow-Up Questionnaire which had closed- or fixed-response alternatives and which included an "other" option with room for the respondent to write in his particular answer. In every case where possible, the "other" choice (when selected by the respondent) was reclassified by the manual editors into the closed-choice options provided. Where this was not obvious or logical, the "other" option was retained in the coding, but the alphabetic description was not included on the data file.

There were four questions (44BA, 69B, 69C, 70B) in the First Follow-Up Questionnaire for which no numeric coding was done. That is, the written replies of the respondents were recorded as they appeared on the questionnaire. The user should be aware of these alphabetic fields and use the appropriate computer techniques to process them.

C. Telephone Follow-Up

Questionnaires which failed the manual edit process, due to having insufficient information available on the "key" questions, were examined carefully by telephone follow-up staff in preparation for a telephone interview with the respondent. Telephone follow-up operators were trained in questionnaire administration as well as questionnaire editing so that they would be capable of coping with any questionnaire-related questions a respondent might bring up. Approximately one-third of all mail-returned questionnaires failed manual pre-machine edit and required telephone follow-up to some degree; less than 5 percent of all questionnaires resulting from individual interviews by Bureau of Census personnel failed this edit.

D. Direct Data Entry Operations

NLS first follow-up data were transformed to machine-readable form by the use of direct data entry, programmable terminals. Major advantages of this type of data transformation included higher speed, fewer processing steps, and lower transcription error rate. The terminals were programmed to accept only values within a specified range for most of the data fields, and only specific field widths for all data items. Acceptable ranges for fixed format variables were decided prior to data entry and were programmed for the terminals; data provided by the respondent which were outside of these *a priori* ranges were specially coded to indicate that condition.

The overall transcription error rate using the direct data entry terminals was less than 0.3 percent.

II. SECOND FOLLOW-UP DATA PREPARATION AND ENTRY

The document flow for second follow-up instruments was quite similar to that of the first follow-up. As instruments were returned, either by mail or from field interviews, they were batched and entered into the automated survey support system. As in first follow-up, each questionnaire was edited for critical items, and if it passed this edit, the questionnaire was passed on for data entry. If it failed the initial edit, the questionnaire was marked for telephone follow-up to resolve the problems uncovered in editing. After telephone follow-up, the updated questionnaire was scheduled for data entry. The data entry process involved some manual coding and transcription to machine-readable format. The various steps of these processes are discussed in more detail in the following sections.

A. Manual Pre-Machine Editing

The pre-machine editing for the second follow-up instrument was similar in nature to the edit used in the first follow-up. A set of critical or key items was defined, and these items were edited for consistency and completeness. (See Appendix B for a complete list of the critical and supporting items.) If respondents failed to properly answer these key items, then the questionnaire was marked as failing edit and was scheduled for telephone follow-up. The key items covered by these edit checks fell into the following areas:

1. Activity in October 1974.
2. Classes or courses from October 1973 to October 1974.
3. Certificate, license, diploma, or degree earned from October 1973 to October 1974.
4. Actual or intended field of study.
5. Type of school attended.
6. Jobs in October 1973 - October 1974.
7. Training programs from October 1973 to October 1974.
8. Armed Forces service.
9. Background (tracing) information such as name, address, and telephone number of respondent and next of kin, and date of birth, sex, and ethnic background.

B. Manual Coding

Manual recoding of alphabetic information into numeric form was performed in a few areas of the Second Follow-Up Questionnaire. Three questions (SQ 61, SQ 76A, SQ 93A) concerning job area or occupation for 1973 and 1974 were recoded into the corresponding three-digit code specified in the Census Index of Industries and Occupations. In addition, the occupation of husband or wife (SQ 108) was also coded in the same manner. The complete three-digit occupational classification scheme is presented in Appendix C.

Another major area involving recoding of alphabetic data concerned school information. Postsecondary school identification, whether of the college or university type or of the vocational-technical type, was coded into six-digit U. S. Office of Education vendor or FICE codes, using a master index provided by OE.* Fields of study (questions 19, 20, 23BB, 23CB, 23GB, 66BB, 66CB, 66GB) reported by respondents who attended school during the post-high-school period were recoded into HEGIS categories, using both the four-digit academic subdivisions provided by the HEGIS taxonomy and the six-digit HEGIS technological and occupational scheme. (See Appendix D.1 for listing of six-digit field of study codes.)

---

*School names and FICE codes have been withheld in order to protect the confidentiality of respondents.

Various specific questions in the second follow-up instrument were given special editing or coding. This special editing consisted of editing of alphabetic answers, multiple response resolution, contextual checking of some answers (see below, SQ20 and SQ147), and special coding for combined answers to some groups of items. The paragraphs below discuss the items involved, the procedures used, and refer to appendices which contain more detailed information.

In the Second Follow-Up Questionnaire there were 24 questions which included an "other" option which gave the respondent the opportunity to write in a special category to fit his particular situation. In every case where possible, the "other" choice (when selected by the respondent) was reclassified by manual editing into the closed-choice options provided. Where this was not obvious or logical, the "other" option was retained in the coding, but the alphabetic description was not included on the data file. However, for eight of these 24 questions (SQ7, SQ12, SQ27M-SQ27U, SQ34, SQ43, SQ47, SQ50, SQ59), new categories were created from "other" responses and assigned codes, thus eliminating alpha data for these eight items. A list of these items with newly created categories and their respective codes is presented in Appendix D.3.

Specific questions in each Second Follow-Up Questionnaire were manually edited to insure only one response to these items. However, some respondents gave more than one answer to a question even though asked to give only one. Two editing procedures--(1) averaging, and (2) choosing either the highest or the lowest answer, depending on the question--were used to resolve those questions with multiple responses. In questions with more than one answer, usually involving a range of hours or dollars, the average of the given values was computed and prefixed with the digit "8" to denote editing. For example, if the respondent answered the question "How many hours did you usually work at this job in an average week?" by saying "30-40 hours," then the edited response would become 835. For 15 second follow-up questions with more than one response, either the highest value or the lowest value was selected and again prefixed with the number "8."

Another type of editing concerned second follow-up question 20. Special editing procedures were employed if the response to SQ20 included more than one field of study. In this case the field of study or training entered in SQ19 was used as a guide for selecting the appropriate answer to SQ20. Again, the edited response was denoted by using the number "8" as a prefix. A complete list of the second follow-up items treated in this manner and the editing procedures for the various resolutions is presented in Appendix D.5.

For two second follow-up questions (SQ44 and SQ113), two additional response categories were created to accomodate group responses to these questions. The first category (SQ44FA, SQ113DA) defines the combination of existing response options, and the second category (SQ44FB, SQ113DB) the dollar amount for the respective groupings. For example, in SQ44, if $5,000 was the amount given for tuition and fees and books and supplies (A and B), the $5,000 would become the response for SQ44FB, with the combination tuition and books denoted in SQ44FA. Numerical codes were assigned all possible response combinations for these two questions. A complete list of possible groupings and their respective codes is presented in Appendix D.6.

Special treatment was given to second follow-up question 142. This item called for only one response, but in a few hundred cases more than one answer was given. Because of these cases, a second item was created. Hence, item 142 has two parts--SQ142A and SQ142B. The first answer appears in SQ142A and the second, if given, appears in SQ142B (the first item encountered in the list was considered the first answer). Special manual editing was also used in SQ147. If "yes" was the response with no explanation given, the response was coded "2." However, if answered "yes" with an explanation, then the response received a code of "3." A final type of editing involved assigning numeric codes to the various branches of the Armed Forces and several military speciality codes. A numerical code was established for each branch of the Armed Forces. If SQ122 was answered, the response was assigned a corresponding numerical code. A list of these military codes appears in Appendix D.4. Additionally, questions 125 and 126B were assigned military speciality codes.* Also, question 126A, concerning military pay grades E1 though E9, was coded numerically. Codes 1 though 9 match pay grades E1 though E9.

C. Telephone Follow-Up

The telephone follow-up procedures used in the first follow-up were implemented for the second follow-up as well. Approximately 40 percent of the questionnaires returned by mail failed edit and approximately 16 percent of those returned by field interview staff failed edit. Over 94 percent of the questionnaires scheduled for error resolution through telephone follow-up were successfully completed. The fail edit rates for second follow-up instruments, both mail and interview, were considerably higher than those observed in the first follow-up.

D. Direct Data Entry Operations

The data entry methodology for second follow-up was the same as the previous year. Programmable data entry terminals were employed. They were programmed to provide rudimentary range checking and field width checks. Additionally, all ID numbers were coded with check digits which were automatically verified by the terminals. Quality control analysis of this phase of data processing revealed a transcription error rate of less than 0.3 percent.

III. ERROR AND MISSING DATA CODES

A set of standard "error" codes were defined and applied uniformly across the file (except as noted below concerning code 95) to indicate certain common classes of erroneous or missing data. These codes are listed below:

---

*These military codes are listed in a Department of Defense publication, "Occupational Conversion Table, Enlisted," Office of the Assistant Secretary of Defense, Manpower, and Reserve Affairs, DOD 1312.1-E, DA PAM 611-12, March 1974.

93 -- Partial response. This code is used only for those questions in the First Follow-Up Questionnaire which employ the two-column response format (e.g., question 1).* Each of these questions consists of a set of sub-items and requires the respondent to indicate whether each sub-item applies or does not apply. If the respondent answered at least one, but not all, of the sub-items for a question of this kind, then those unanswered sub-items were coded 93 to indicate a partial response to the question.

94 -- Don't know. This code indicates a written response by the student indicating he did not know the answer.

95 -- Out-of-range response. This code is used when the response or transcription exceeds the specified field width. Additionally, for the second follow-up items in Table 8, 95's were assigned to values outside the listed ranges. This code is described more fully in the following section.

96 -- Multiple response. This is used if the respondent gave several answers to a question when the directions called for only one, and the multiple response could not be resolved.

97 -- Refusal. The respondent refused to answer an item either by written statement or in the interview.

98 -- Blank, or nonresponse. This code represents nonresponse in all cases other than those identified as legitimate nonresponse (see below).

99 -- Legitimate nonresponse. This is used when the respondent should not have answered the question and did not, i.e., he was routed around an item. As well, if the respondent did not answer an entire instrument, then all fields representing that instrument were coded 99.**

The above codes apply to data items with two-digit fields only; there are items requiring larger field widths. Thus, for items with three-digit fields, the error codes have two leading nines followed by the appropriate digit indicating the particular class of error--that is, 993 through 999. For four-, five-, and six-digit fields, the number of leading nines was increased accordingly.

---

[*] The following first follow-up questions received 93 codes: 1, 16, 22A, 24, 29B, 31, 35, 38, 44B, 48B, 54B, 62, 63, 71, 76.

[**] Both the 98 and 99 codes are further defined, with examples, in Section IV.C.

IV. MACHINE EDITING PROCEDURES

Some of the major steps taken toward preparing the NLS data tapes for public release included "hard copy" (source document) spot checks and machine editing, which involved recoding all uninterpretable responses and some logical recoding of other responses. As a result, the final data file contains only (a) valid response codes,* (b) codes describing type of erroneous or missing data, and (c) "logically recoded values" including, in each case, an indicator for the reasons for such a recode (see Section C concerning routing checks).

Three sequential machine editing programs were employed and are described below. (These programs were not applied to the NLS base-year data, since these data were already subjected to editing procedures employed by the previous contractor. The base-year data were simply reformatted, and in some cases recoded, to achieve consistency with the first follow-up data on the file.)

A. Range Checks

The first program in the editing sequence dealt with out-of-range data. This program checked the responses to each fixed-response item against a specified range of acceptable values, "flagged" any value that fell outside of this range, and recoded each flagged datum to 95 to indicate the occurrence of an out-of-range response. It should be noted that this recoding procedure was applied to fixed-choice items only. In the first follow-up, acceptable ranges were also specified for 71 free-response items calling for numeric data, and the frequency of responses outside these ranges has been tabulated in Table 7. This table lists the 71 free-format items and the ranges that were established for each question. In almost all cases, there were some responses observed outside of these ranges. In general, these responses were logically possible but were considered highly improbable. The frequency counts of data that occurred outside of these ranges are also listed in Table 7. Appendix J lists in detail the range and frequency of these data. It is recommended that the user make his own decisions as to what are acceptable data for these items, using as guidelines the ranges set forth in Table 7. It was felt that in some cases these outlying responses may provide additional information and that it was best to leave them in the file to provide as faithful a transcription of the original records as possible.

---

*The 71 free-format items in the first follow-up include responses outside the specified range of acceptable values.

In the second follow-up range editing, acceptable ranges were defined for 60 items. The ranges for these items are presented in Table 8. The second follow-up range editing was somewhat different than first follow-up in that values observed outside these specified ranges were recoded to an error code (95). The ranges specified for second follow-up items were considerably wider than those used in the first follow-up (compare Tables 7 and 8). The exclusion of values outside the defined second follow-up ranges was considered to be reasonable since values beyond these bounds were highly suspect. Hence, there will be no values in the data tape outside these ranges for these second follow-up items.

B. Consistency Checks

The second program of the machine editing sequence was concerned with checking the consistency of an individual's responses over the entire questionnaire. For the first follow-up, a set of 94 internal checks, or response comparisons, were selected on an *a priori* basis for this purpose. In the second follow-up instrument, two sets of consistency checks were defined. The first set deals with manually edited questionnaire items (key items), while the second set deals with those items not subjected to manual edits. The consistency program read the responses comprising each individual's record and flagged those consistency checks which were failed. As will be described in a later section, indices were subsequently computed for each record based on the number of consistency checks failed by the individual. These indices reflect the internal consistency of a record and, therefore, provide the user with a rough indication of the quality of each respondent's data.

C. Routing Checks

The first follow-up instrument contains 33 routing questions, and the second follow-up instrument contains 52 routing questions. A routing

question is one that either implicitly or explicitly directs a respondent around other questions in the instrument. The aim of the routing questions is to quickly move respondents around questionnaire sections that do not apply to them. In order to determine if the respondents correctly followed the routing patterns, a routing-check program was developed and implemented. This program read each record and flagged responses to all routing questions which were inconsistent with the subsequent pattern of response. Two kinds of routing flags were used; one indicating the type of inconsistency and the other the level of inconsistency. Three types of inconsistencies have been identified:

1. A first type of inconsistency occurs when the response to a routing item indicates that the questions associated with that item (i.e., contained within the routing pattern) should be skipped but are not (error of commission). When this type of inconsistency was detected, the response to the routing question was recoded by adding 20 to the original response code.
2. A second type of inconsistency occurs when the response to the routing item indicates that the questions associated with that item should be answered but are not (error of omission). Here recoding involved adding 40 to the routing-question response code.
3. The third type of inconsistency is actually a combination of the first two types. This type of inconsistency arises when the response to the routing item indicates that certain questions should be skipped but are not (type one) and other questions should be answered but are not (type two). In these cases, recoding involved adding 60 (20 + 40) to the routing question response codes.

The following examples should provide further clarification of the testing and recoding procedure employed by the routing check edit program.

Consider First Follow-Up Questionnaire, item 2. This question asks if the student is still in high school. If he is not in school, question 3 asks for the date he left. The example below illustrates the routing pattern.

Q.2. Did you complete high school?

(Circle one.)

No, still in high school . . . . 1 — (SKIP to Q. 4)
No, left high school without completing. 2
Yes, graduated 3
Yes, left high school without graduating but have since passed a high school equivalency test, for example, the GED 4

Q.3. When did you leave or graduate from the last high school that you attended?

Date left: ___A___ (month) ___B___ (year)

Q.4. With whom did you live, as of the first week of October 1973?

If the respondent circles a 1, he is instructed to skip question 3 and continue with question 4. If the respondent circles 2, 3, or 4, he is expected to answer question 3 and then go on to question 4.

There are several possible ways that a respondent can respond inconsistently to this kind of routing question. Appendix E lists the possible responses to the routing questions present in the First and Second Follow-Up Questionnaires and the codes that indicate different patterns of consistent and inconsistent response to each routing question. Again, consider the above example. Reference to Appendix E.1 shows eight possible codes listed for first follow-up question 2. The codes 1, 2, 3, and 4 reflect responses that meet the logical flow of the routing pattern. The codes that have 20 or 40 added to them--21, 42, 43, 44--indicate a violation of the logic of the skip pattern. Code 21 indicates that, even though the respondent circled a 1, he responded to at least one part of question 3. The 40 codes (42, 43, 44) indicate that the respondent failed to respond to question 3 even though the routing pattern directs him to it. Appendix E.3 lists the routing codes for the second follow-up instrument.

A second, more complex example of the recoding procedure employed by the routing-check program is provided by question 23 of the First Follow-Up Questionnaire. The routing pattern prescribed by this question is illustrated below.

Q.23. Since leaving high school, have you attended any school like a college or university, service academy, business school, trade school, technical institute, vocational school, community college, and so forth?

Yes . . . . 1 — (SKIP to Q.25)
No 2

Q.24. Here are some reasons others have given for NOT continuing their formal education after leaving high school. Which of these reasons, if any, apply to you?

(Circle one number on each line.)

		Applies to me	Does not apply to me
A.	Needed to earn money to support my family. . .	1	2
B.	Needed to earn money before I could pay for further education.	1	2
C.	Could not afford a four-year college or university education	1	2
D.	Failed to find out in time about admission requirements, cost of attending, availability of a school in the area, etc.	1	2
E.	Poor high school grades or poor scores on college admission tests.	1	2
F.	Lack of high school credits required for college entrance	1	2
G.	Applied to one or more schools, but was not accepted	1	2
H.	Lack of a school within communting distance of my home	1	2
I.	Discouraged from continuing by teachers or counselor	1	2
J.	Discouraged from continuing by parents	1	2
K.	Wanted to enter Armed Forces	1	2
L.	My plans did not require more education. . . .	1	2
M.	Planned to be married.	1	2
N.	School is not for me; I don't like it.	1	2

Q.	Wanted practical experience before going on to school	1	2

(SKIP to Section C, page 15, Q.48a)

SCHOOL ATTENDANCE IN OCTOBER 1973

Q.25. Were you taking classes or courses at any school during the first week of October 1973?

What makes this example more complex than the previous one is that two sets of items are contained within the routing pattern (see Appendix E.1) and, based on the answer to question 23, the respondent is instructed to answer one set of items but not the other set. Thus, if the respondent circles a 1, he is instructed to skip questions 24A through 24Q (the first set of items) but not questions 25 through 47 (the second set of items). If, on the other hand, the respondent circles a 2, then he is instructed to answer questions 24A through 24Q and skip questions 25 through 47. Appendix E.1 lists eight codes for question 23. A code of 1 or 2 indicates that the individual's responses were consistent with the above instructions. However, if the respondent answered both sets of items, then 20 was added to his routing question response, resulting in a recode of either 21 or 22. If the respondent skipped both sets of items, then 40 was added to his routing question response. Finally, if the respondent incorrectly answered one set of items and also incorrectly skipped the other set of items, then 60 was added to his routing question response code.

One other function of this level of routing-check program is to differentiate between legitimate nonresponse (coded 99) and other nonresponse (coded 98). Legitimate nonresponse is defined as nonresponse to questions that the respondent has been routed around. If a respondent is routed into a block, then any nonresponse to those items is considered illegitimate; that is, he is expected to answer all items in the block. As well, if the routing pattern is answered in a manner inconsistent with the routing instructions (i.e., the routing question response has 20, 40, or 60 added to it), then any nonresponse is considered illegitimate for these items. The only time that nonresponse would be coded 99 (legitimate nonresponse) is when the respondent has an unflagged response to the question that routes him around a group of questions. Again, consider the first example--question 2. If a respondent has a response of 1 (unflagged), then the nonresponse to the two parts of question 3 would be coded 99. If he responds to question 2 with a 2, 3, or 4 and leaves a part of question 3 unanswered, then that nonresponse is coded 98--illegitimate nonresponse. The effect of this coding for nonresponse is to overestimate the illegitimate nonresponse. That is, in cases where a respondent's pattern of response does not give a clear indication which questions he should answer, then the nonresponse in that pattern is coded 98. In some of the more complex routing patterns, nonresponse will be coded illegitimate (98) for a large section of items due to one inconsistency. This implies that the user should be quite careful in interpreting the 98 and 99 codes. For some analyses the user may wish to redefine legitimate and illegitimate skips. Appendix E.2 lists all the questions in the first follow-up that are inside one or more routing patterns. The second follow-up routing patterns are listed in Appendix E.4. In order to determine the legitimacy of nonresponse, one must consider all of the routing questions that cover a given question. Reference to Appendices E.2 and E.4 will show which routing questions need be checked. A question that does not appear in these listings is not contained within any routing patterns.

The second routing error flag deals with the consistency or inconsistency of a given item, regardless of whether it is a routing item or not, with respect to all other routing items that control it.* But prior to discussing this level of routing error codes, it is necessary to describe and define the structural relations that exist in the NLS routing patterns. In general, a routing pattern consists of the routing item, the items internal to the routing item, and the range of items that can be skipped. An example will illustrate these terms. In Figure 1, items A and E are routing items; items B, C, D, E, F, G, H, and I are internal items; item E is both a routing item and an internal item. The range of routing item A is items B through I, and the range of routing item E is F through G. The definitions of external and internal are a function of the range of the routing item. A routing item is external to some other item if and only if the other item is within the range of items that the routing item controls. In the example in Figure 1, routing item A is external to items B through I, and routing item E is external to items F and G. Conversely, items B through I are internal to A and items F and G are internal to both E and A.

---

*Appendices E.2 and E.4 detail the items that are controlled by routing items and which routing items are themselves controlled by other routing items.

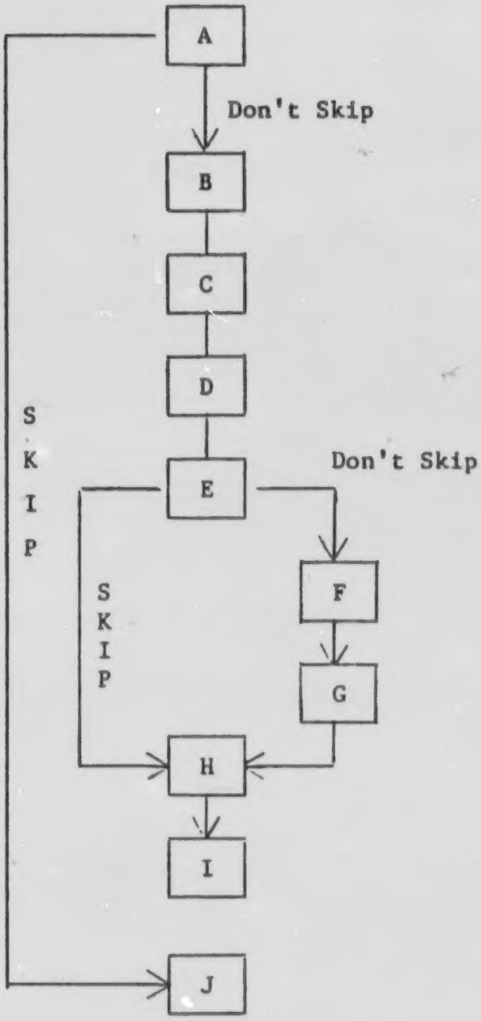

Figure 1. A Doubly Nested Routing Pattern

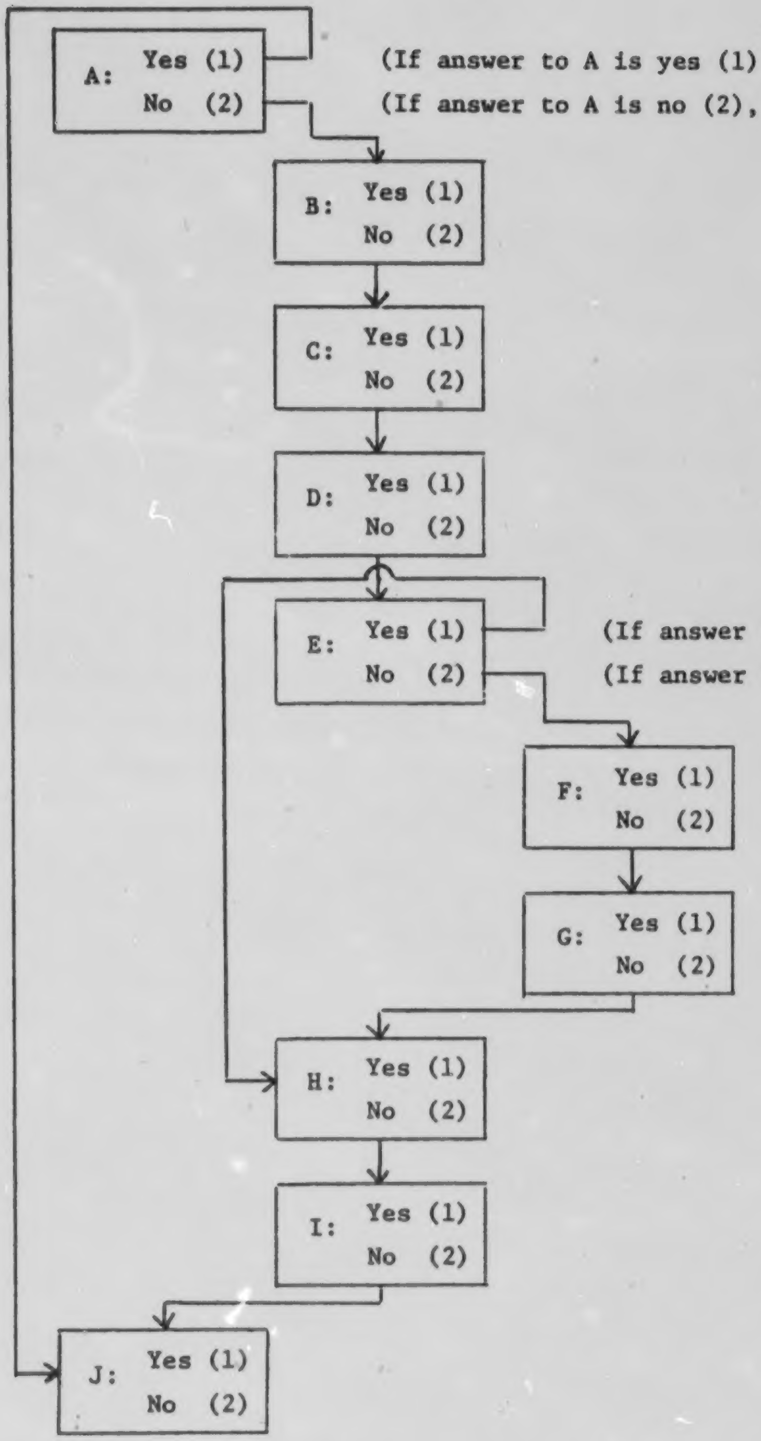
Given these definitions, a set of coding rules was developed to label the various routing errors that occurred. It did not seem reasonable to attempt to code the full complex of information about all the possible patterns of responses leading up to a given item. A simpler solution was the use of a code for each item to indicate consistency (0), inconsistency (1), or multiple inconsistencies (2) with the routing item or items external to it. In the case of the routing items themselves, a code is used to indicate the consistency or inconsistency of the routing item with routing items external to them. Consider the example shown in Figure 1. For routing items A and E there are three possible states each: (1) correct, (2) error of commission, and (3) error of omission. For example, if in the pattern in Figure 1 a subject had made an error in routing item A; that is, he responded to A in a manner that indicates he should skip and he responded to items C, D. E, and G, and in routing item E he also responded as if he should skip, then the codes would be as follows:

> Items B, C, D, F, G, H, and I would be coded with a leading 1 to indicate these items are suspect; item E would be coded with a leading 1 to indicate that this routing item is inconsistent with the routing item that controls the pattern, i.e., item A. As well, both routing items would have the flags already provided by the first level of routing codes to indicate the type of error that exists specific to the single routing pattern.

This method of coding provides two levels of coding. It flags all items as to their consistency with the routing patterns to which they are internal, and it provides special codes for the routing items to give partial information concerning the depth and complexity of the routing violations, if any exist.

A more detailed example may serve to more clearly define the coding methodology. Figure 2 is a schematic outline of a doubly-nested skip pattern with response alternatives assigned (here limited to only two choices) to each item. In Figure 2 each item has two response alternatives--"yes" and "no." The number in parentheses after the "yes" and "no" indicates the basic category codes that would be used to record the answers--1 for "yes" and 2 for "no." In items A and E a "yes" answer



(If answer to A is yes (1), go on to J.)
(If answer to A is no (2), go on to B.)

(If answer to E is yes (1), go on to H.)
(If answer to E is no (2), go on to F.)

Figure 2. Detailed Doubly-Nested Routing Pattern

indicates the respondent should skip the next set of nested questions. A response of "no" to item A or E indicates that the respondent should go on and answer the nested items.

Given these ground rules, consider the following example. Suppose a respondent has supplied the answers listed in column 2 of Table 9. Given these responses, it can be seen that the respondent has violated both the skip patterns in the example. This causes the 20, 40, 60 flags, described earlier, to be used on the routing items; note that these codes are applied only on routing items. The exact flag used is indicated in column 3 of the table. Column 4 of the table presents the additional codes given by the second set of coding procedures. First note that one extra digit, the left-most, has been added to the codes used in column 3. In all cases, the two right-most digits of columns 3 and 4 are the same. Hence, the only additions lie in the use of this extra digit.

In column 4, the new digit is always 0, 1, or 2. A zero indicates that the datum is "consistent" with all external routing items. In the example only items A and I are labeled "consistent." A code of one indicates a given item is "inconsistent" with an external routing item. In the example, items B, C, D, E, H, and I are labeled "inconsistent" because of violations of one external routing item. Items F and G are labeled with a 2 to indicate multiple violations. In general, the left-most byte of each datum is used to indicate this level of routing consistency.

V. QUALITY AND ANALYTIC INDICES

Two kinds of composite indices--quality and analytic--are included in the NLS data file. The quality indices focus on a single individual and quantify the amount and quality of information present in an individual's record. In contrast, the analytic indices are derived from global considerations of the entire file and serve primarily as classificatory variables which can be used to group individuals. The quality and analytic indices included in the data file are described below.

[1] Coding scheme used in level 1 of routing error.

[2] 21 = 20 + 1 since should have skipped but did not.

[3] 98 codes, since external skip pattern was violated.

[4] 42 = 40 + 2 since should not have skipped F and G but did.

[5] The leading 2 codes indicate multiple routing item violations.

A. Quality Indices

Four quality indices have been developed in order to quantify the amount and quality of First Follow-Up Questionnaire data present in each record. Similarly for Second Follow-Up Questionnaire data, five quality indices were computed and occupy a three-digit field on each record. A summary of these quality indices for First Follow-Up and Second Follow-Up Questionnaire data are presented in Tables 10 and 11 respectively.

1. Consistency Index (CS)

The first follow-up consistency index represents the percentage (truncated) of a set of 94 consistency checks failed by an individual. The index was computed as follows:

$$CS = \left(\frac{\sum_{i=1,94} X_i}{94} \right) 100$$

where $X_i = 0$ if respondent passed check i; 1 if respondent failed check i.

Two consistency indices were developed for Second Follow-Up Questionnaire data, with SFU consistency index 1 calculated from manually edited data. Index 1 represents the percentage (truncated) of a set of 36 consistency checks failed by an individual. SFU consistency index 2 was computed from data not manually edited and represents the percentage based on a second set of 21 consistency checks. The same formula for computing the first follow-up consistency index was used to obtain those for Second Follow-Up Questionnaire data. It is evident from the results in Table 11 that responses were considerably more consistent for manually edited data than for data which received no manual edit checks.

2. Out-of-Range (OR) Index

This index represents the percentage of out-of-range responses for an individual's record, and was computed as follows:

$$OR = N/D * 100$$

where N = the number of items with response codes of 95 (out-of-range)

and D = the number of items with response other than 99 (legitimate skip).

3. Routing Index (RI)

This index represents the percentage of the routing questions that were ambiguously answered by an individual (i.e., routing questions which were unanswered or answered in a manner which was inconsistent with the respondent's subsequent pattern of response). The routing index was computed as follows:

$$RI = N/D * 100$$

where N = the number of flagged routing questions and

D = the number of routing questions with response other than 99.

4. Completeness Index

There are actually five first follow-up completeness indices--one for each major section (A-E) of the First Follow-Up Questionnaire. However, the second follow-up instrument is composed of six major sections (A-F), thus the existence of six second follow-up completion indices. For a particular section, the completeness index represents the percentage of items with valid responses--that is, responses that are not coded as errors or missing data (FFU codes 93-98, SFU codes 94-98). The index was computed as follows:

$$CIx = N/D * 100$$

where x = the particular section of the questionnaire,

N = the number of items with valid responses (responses other than error or missing data codes), and

D = the number of items with response other than 99.

The first follow-up completion indices are presented in Table 10. They indicate a lower completion rate for Sections A and B as compared to other sections of the first follow-up instrument. For Sections B and C in the Second Follow-Up Questionnaire the completion rates displayed in Table 11 appear to be lower than for the remaining sections of the instrument. These results are artifactual and may be misleading. The major utility of this index lies in judging the completeness of an individual's responses within a given section of the instrument. The various sections of the instrument vary in complexity, number of routing patterns, and type of information elicited; and due to these differences the index is not as comparable over sections as within sections. Specifically, Section A in the first follow-up instrument contains fewer routing patterns than other sections, and it contains some items (e.g., FQ1G, FQ16F) for which one may expect larger nonresponse. In addition, the coding rules for FQ11 in Section A code all nonresponse as 98 which inflates the nonresponse for this section. Similarly, Second Follow-Up Questionnaire, Section B, also contains some items (e.g., SQ18, SQ25J, SQ37) for which a larger nonresponse is expected. Hence, it is best to examine the distribution of completion indices only within a section. Review of the indices within a section will illustrate the typical completion rate and identify outlying individuals.

The user should be cautioned that the utility of these quality indices is in the determination of the credibility of individual records. They have little utility for making judgments about data over respondents such as item response, since the real test of item response quality is the over-subjects distribution. These indices should not be considered for discarding subjects unless one's concern is with the entire instrument or sub-section.

B. Analytical Indices

Also included in the data file are two composite indices useful for many analyses. One is an ability index, and the other is a socio-economic status (SES) index. Each of the indices involves several components and required several steps in its derivation. They are briefly described in the following paragraphs. Since other procedures and components may be employed in deriving such indices, users are encouraged to decide for themselves whether the analytical indices included here are appropriate for their particular needs or purposes.

1. Ability Index

Each participant in the NLS was given a code of 1, 2, or 3 depending on whether his ability composite score was in the lower, middle two, or upper quartile range. The cutoff points were as follows: 3 = upper quartile if >225.7497, 2 = middle two quartiles if ≤225.7497 and ≥181.5461, 1 = lower quartile if <181.5461. The composite score was derived from four test scores. The tests were vocabulary, reading, letter groups, and mathematics. It was decided that a simple sum over the four standardized test scores (each with a mean of 50 and a standard deviation of 10) would suffice as a general ability index. This decision was based on the fact that a principal components analysis yielded a first principal component with essentially equal weights to the four tests. Likewise, the rotated factor which explained the most common variance gave essentially the same result.

2. SES Index

Each participant in the NLS was also assigned a code of 1, 2, or 3 depending on whether his SES composite score was in the lower, middle two, or upper quartile range. The cutoffs for the SES index were as follows: 3 = upper quartile if >+0.4409, 2 = middle quartiles if ≤+0.4409 and ≥-0.4975, 1 = lower quartile if <-0.4975. The SES composite had five components: father's education, mother's education, parents' income, father's occupation, and household items. These components were first subjected to factor analysis which revealed a common factor with approximately equal weights for each component. Each of the components was then standardized and an equally weighted combination of the five standard scores yielded the SES composites.

C. Composites

There are several composite variables in the data file. They fall into two basic categories: (a) composite scales--computed from several subitems within a questionnaire, and (b) composite classifiers--computed from several instruments over the various time points of the data collection. The paragraphs below outline their construction.

The composite scales are defined in Table 12. They were computed as the average of the listed items; with the exception of family orientation, all subitems are averaged with positive unit weights. In the computation of family orientation, subitem I has a negative unit weight (i.e., family orientation = B + H - I). If one of the subitems was missing, then the available subitems were averaged. In all cases the scores for the individual subitems are available in the data base if it is desired to recalculate these scales in a different manner.*

The composite classifiers were created by combining all sources (instruments) of information to produce the best estimate of these classifiers. These variables are race (CRACE), sex (CSEX), high school program (HSPGM), father's education (CFAED), mother's education (CMOED), father's occupation (CFAOCP), and birthdate (BIRTHMON, BIRTHDAY, BIRTHYEAR). They were created by examining all sources of pertinent information to produce a single best estimate value for each classifier. The procedure for creating these composites is illustrated by the process for producing high school program. The high school program was available from four sources: base-year Student Questionnaire (Q2), First Follow-Up Questionnaire Form B (Q86), Special Activity State Survey (Q13), and the Student Record Information Form (Q7). It was possible for information to be available from any combination of these sources. The composites served to place in one location a value selected from the available sources. This insures that the maximum number of cases are classified. In addition to selecting from the available sources, checks were made for inconsistencies. Inconsistencies that were found were resolved by hard copy checks.**

---

*The work, family, and community composites were not computed for 1974 but are available as the average of the subitems.

**The sources available for these classifiers are also discussed in Part 2, Section C.5, Assembling Classifier Variable Data.

Part 4: Contents and Organization of the Data File

I. OVERVIEW

The data base contained in the release data file consists of 22,532 records. The NLS sample contains 23,451 students, but those students who did not respond to any student instrument (BSYR, FFU, or SFU) are not included in the data file (there are 919 such cases). Appendix J of this manual contains a complete and detailed listing of the variables and variable frequency distributions in the NLS tape file. This appendix presents, for each variable, the variable number, a short variable label (this matches the variable labels added to the instruments in Appendix A), the tape location, a longer variable title, and a completely labeled frequency distribution for all codes that occur for that variable. The continuous variables or variables with very large numbers of values are presented as shortened frequency distributions. The fields that contain alphabetic information have shortened frequency distributions. Appendix K contains a subject index of all NLS variables in alphabetic order that relates variables, by subject, to the variable label. This index facilitates location of the various items or indicators in the data file. One additional appendix, Appendix F, serves as an aid to locating variables in the data file. It contains, in numerical order, a list of the short variable labels for each variable in the file.

Reference to Appendix J and to the instruments in Appendix A shows that a number of the NLS variables (items) from each of these instruments were not included on the release file. Items were excluded primarily to protect the confidentiality of individual participant's data. In addition, a number of items were deleted or modified due to excessive prior editing or poor response. Appendix G lists the items that were deleted.

An examination of the variable list shows that the data in each record are, in general, grouped by type and ordered as follows: identification codes, data indicators, Test Book data, Student's School Record Information Form (SRIF) data, base-year Student Questionnaire data, First Follow-Up Questionnaire data, Second Follow-Up Questionnaire data, quality indices, sampling weights, analytic indices, and activity states.

A. Identification Codes

Two different identification codes appear at the beginning of each record. One student ID code (RTI ID) is a random five-digit number which appears in the first five character positions of each record. The other is a school code (SCHCODE), a random four-digit number, which may be used to group together students from the same high school.

B. Data Indicators

Several indicators have been included in the release file to assist users in processing the data records. Indicators are available that indicate the presence or absence of large blocks of data within an individual record. These indicators are available for the following logical blocks of data: Test Book (TB IND), SRIF (SRIF IND), Base-Year Student Questionnaire (BSYR IND), Sections D through J of the Student Questionnaire (D IND through J IND), First Follow-Up Questionnaire (F IND), and Second Follow-Up Questionnaire (S IND). As well, the presence of a nonzero weight serves as an indicator for some variables (e.g., Form A or B of the first follow-up).

C. Test Book Data

As noted earlier, each student in the base-year survey was asked to complete a battery of six tests, including: vocabulary, picture number (two parts), reading, letter groups, mathematics, and mosaic comparisons (three parts). Total test scores were computed for each of these tests. In addition, sub-test scores were computed separately for each part of the picture number and mosaic comparisons tests. Thus, the test battery data for each record consists of 11 subtotal and total scores in all. For each test or sub-test, the formula score (FS) was computed from the item response as:

$$FS = R - W/(C-1)$$

where

R = number of right responses,
W = number of wrong responses,
C = number of responses to item.

The 11 formula scores are stored in each record. Ten are four-digit scores with two implied decimals; the mosaic comparisons total score is five digits with two implied decimals.

In addition to the formula scores, the test scores were standardized across the sample with a mean of 50 and a standard deviation of 10. These scores range from 1-99; each score is three digits. The standardized scores are more appropriate than the formula scores for forming linear combinations of test scores for analysis.

D. Student's School Record Information Form Data

Data from the SRIF were coded and edited according to the previous contractor's specifications and stored in the data file. The SRIF contains information related to the student's high school records. It covers the student's high school grade average, college admission test scores (SAT, ACT), information concerning courses taken, and major course of study. Certain items from the SRIF contain alphabetic information and must be processed accordingly. For example, the student's average may be numeric or alphabetic depending upon the grading system used by the school. Similarly, the lowest and highest grades used by the high school may be alphabetic or numeric. These variables are labeled SRIFGRCD, SRIFLWGR, and SRIFHGGR, respectively.

The student's percentile rank (%R) in class was computed as follows:

$$\%R = 1 - \frac{\text{rank in class}}{\text{total in class}} \quad 100$$

For some cases, insufficient information was available for the computation of %R. For these cases, estimates were made from regressions of %R on reported (in SRIF) high school grade averages for several different grading systems. Where information was insufficient for making the estimates as well as for computing %R directly, the case was excluded. Table 13 presents estimates of %R for grade averages reported in a number of systems. It may also be used to convert grades from one system to another. The procedure used to develop this table was that of nonlinear regression of reported grades on percentile rank in class for

numerical grading systems. Letter grade equivalents were obtained by computing the mean percentile ranks for each letter grade. Student averages imputed from this nonlinear regression procedure are labeled in the data records. A more detailed description of this method and its codes is presented in Appendix H.

E. Base-Year Student Questionnaire Data

These data were also coded and edited according to the previous contractor's specifications and are located in the data file as variables BQ1 through BQ800.

F. First Follow-Up Questionnaire Data

The procedures used in coding and editing responses to the First Follow-Up Questionnaire are described elsewhere in this manual. The data obtained from this instrument are variables labeled FQ1A through FQ85G.

In almost all cases the various questionnaire items were coded in a format that was a one-to-one match with the instruments. There were two exceptions--first follow-up questions 46 and 47 (FQ46AA through FQ47GB). In question 46B, two additional response variables (FQ46BF and FQ46BG) were added to include cases where a respondent gave a total for a combination of items. Item 46BF is a source code that can have up to four distinct values (e.g., 1234, 1235, 2345) indicating the various combinations of expense categories. As many as five sources are possible, and if all five were checked, a single code of 0006 was used. Item 46BG contains the amount that was reported for the combination shown in 46BF. For example, if a respondent stated he spent $1,500 for tuition and fees and for room and board, it would be coded as follows:

46BF	0012
47BG	1500

The 0012 code in 46BF indicates that the categories of tuition and fees (code 1) and room and board (code 2) were combined.

Question 47 was coded to allow for seven possible pairs of responses. Each response pair consists of two fields on the data file--the first for a source code entry and the second for a corresponding dollar amount entry. The source codes were 01 through 25 as indicated in the questionnaire. Source codes 26 through 30 apply to the major categories SAVINGS OR EARNINGS, INDIVIDUAL SUPPORT, SCHOLARSHIPS OR GRANTS, LOANS, and OTHER, respectively, when the respondent provides a total dollar amount for a category rather than separate dollar amounts for each individual source. Code 31 applies when the respondent provides a total dollar amount for the entire question.

Data from questions 86 through 99 of Form B of the First Follow-Up Questionnaire were recoded and placed in the locations allocated for their corresponding base-year equivalents, as indicated in Table 14.

Table 14

Hence, for some respondents, the base-year Student Questionnaire indicator will indicate that these student data are not present; however, since retrospective information was obtained from Form B, there may be data present for these 14 questions. Weight W2 and the base-year Student Questionnaire indicator taken together will identify those respondents who have retrospective base-year data. That is, if a respondent has a nonzero value for W2 (the extended base-year weight) and a value of 2 for the base-year Student Questionnaire indicator (BSYR IND), then that respondent supplied retrospective base-year data.

G. Second Follow-Up Questionnaire Data

The previous sections of this manual describe in detail the procedures used to edit and code the second follow-up data. The relatively few cases where data is not coded as indicated in the instrument are discussed in Section II.B--Manual Coding. The second follow-up items are labeled SQ1A through SQ153I.

H. Quality Indices

The quality indices relating to the first follow-up portion of a respondent's record (and described elsewhere) are labeled FCSIND, FORIND, FCIAIN, FCIBIN, FCICIN, FCIDIN, and FCIEIN. The second follow-up quality indices are labeled as follows: SFUORIND, SFUCIAIN, SFUCIBIN, SFUCICIN, SFUCIDIN, SFUCIEIN, SFUCIFIN, CINDEX1, and CINDEX2.

Each record also contains an inconsistency score for base-year Student Questionnaire data, labeled INCONSC. This score was computed for a set of 37 Student Questionnaire item comparisons. The inconsistency score ranges from 0-4.

I. Sampling Weights

A complete description of the computation of student sampling weights was provided in an earlier section of this manual. These weights are labeled W1 though W12.

J. School Variable Data

Three variables from the School Questionnaire were selected for inclusion in each student's data record. They are region, type of community, and senior class enrollment. These variables are labeled REGION, COMMUNIT, and SENIORS, respectively.

K. Analytic Indices, Activity States, and Composites

These entries in the data file are the SES and ability composites, the SES raw score, the activity state variables for 1972, 1973, and

1974, a planning state variable, and over instrument composites. The ability raw score is available in the file by taking the sum of the scaled ability test scores. The activity state variables are discussed in detail in Appendix M.

There are several composite variables in the file. These composites represent classifier information pooled over the several instruments, or scales created by averaging several subitems. The classifier variables are race, sex, father's education, mother's education, and father's occupation (CRACE, CSEX, CFAED, CMOED, CFAOCP). These variables used information from all instruments to arrive at a "best" estimate of these classifiers. The other group of composites consists of scale scores made from several items. These composites are: locus of control (LOCUS72, LOCUS73, LOCUS74), self-concept (CONCPT72, CONCPT73, CONCPT74), and three life goals scales (WORK72, WORK73; COMM72, COMM73; FAMILY72, FAMILY73) concerning work, community, and the family.

L. Number of Cases in the Data File

The number of respondents available for various subpopulations and for various combinations of instruments are tabulated in Table 14. This tabulation provides a summary of the amounts of data available for the several instruments over the survey periods. A diagram of the relationship of the various subpopulations in the data base is shown in Figure 3.

Both the diagram (Figure 3) and the table (Table 15) show the patterns of data availability in the data base. Table 15 presents the amounts of data available for each instrument independent of the others (columns 1 to 5) and for various combinations of the instruments (columns 6 to 12). The pattern of response for various classifier variables is also presented. Examination of the table indicates that data are available for all three student instruments (BSYR, FFU, SFU) for 14,900 respondents.[*] There are 5,294 respondents with FFU and SFU, and there are five other subsets of respondents (735 to 134 people) with either two or only one student instrument. Figure 3 illustrates the relationships of these various subsets of data.

---

[*] If one is concerned with only certain base-year items (Form B items), then data is available for another 4,539 Form B respondents from the First Follow-Up.

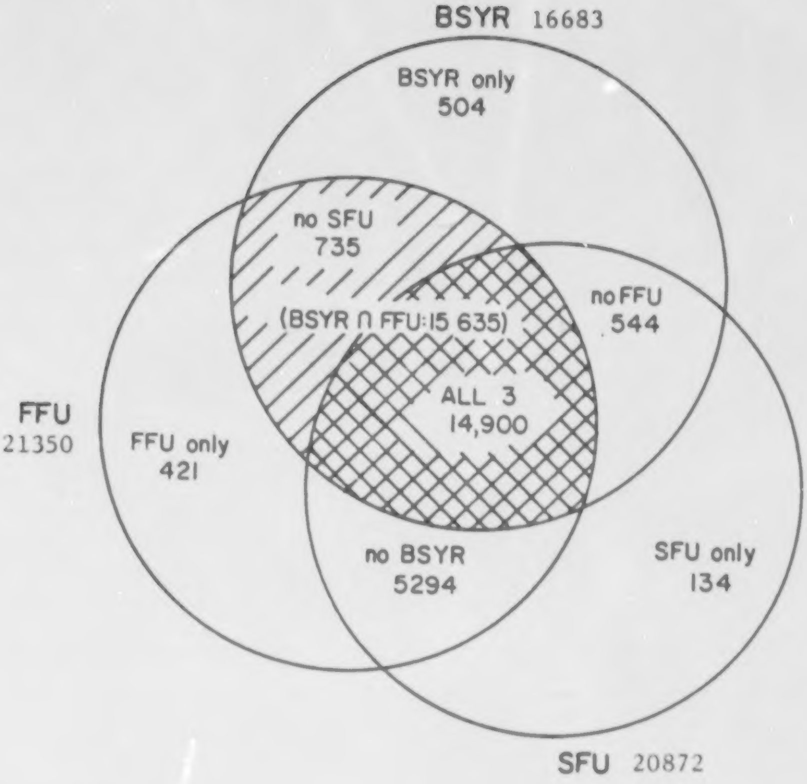
Figure 3

SUBPOPULATIONS OF INSTRUMENT RESPONSE

IN THREE YEARS OF DATA COLLECTION



Part 5: Technical Specifications

The data file consists of 22,532 records--one for each NLS participant (a response to either the base-year Student Questionnaire, First Follow-Up Questionnaire, or Second Follow-Up Questionnaire). Each record is 4,086 bytes long and contains 1,495 variables. The block size is 16,344 bytes, and the record format is fixed block. The file resides on a nine-track tape with an IBM standard label and data set name NLS.RELEASE.JUNE76. Three reels of tape are required to hold the data file using a recording density of 1,600 bytes per inch.

The data file is simple in structure: that is, each fixed-block record contains the same number of data fields. As such, the file can be used with most commonly used "canned" statistical packages (e.g., SPSS, SAS, BMD). Users are reminded that most of these packages have a limitation on the number of variables that can be defined on a given run, and this limit will probably be exceeded by the number of variables in the release file. Users must therefore be prepared either to build smaller working files or to change the control cards to the particular package when different subsets of the file are desired. Also, be aware that, with the block size of over 16,344 characters and normal buffer allocation (two buffers on an IBM 370 system), additional core may be necessary to utilize these packages.

The file consists of 5,633 blocks--four records per block. This fact and consultation with the local computer facility's user service can determine the amount of time required to read the tape at that facility. The overall job time is a function of the tape read time and the number of variables requested in the package's variable list. Users are cautioned to select only those variables which are absolutely necessary, since the run time is a function of the number of variables read. Users are also cautioned to look carefully at the accompanying documentation to determine which fields are alphabetic prior to attempting to use the packages.

The coding scheme was designed to allow for straightforward use of packaged programming systems. It has been only partially successful, however, due to the size and complexity of the data base. Consequently, users must carefully attend to the file documentation and study the codes used for each variable of interest to insure that they are used properly. Given such attention, it is possible to use canned programs and obtain satisfactory results.

DIRECTIONS

- This questionnaire is divided into sections of questions. All students are asked to start by answering questions in the sections lettered A, B, and C. Then you will be asked to follow the directions to answer questions in the sections that apply to *your* particular plans for the year after you leave high school.
- Read carefully *all* directions for each question you answer. It is important that you follow these directions carefully.
- When you are asked to circle a number, please make a heavy black circle. Here is an example.

What grade are you in?	**(Circle one.)**
Grade 9	1
Grade 10	2
Grade 11	3
Grade 12	[✓ 4]

- Circle as many numbers as the directions indicate for each question you answer.
- Completely erase any answers you wish to change.
- When you have completed the questionnaire, put it in the envelope that has been given to you and seal the envelope. No one at your school will see or read your answers.

  This questionnaire is not a test. You may omit any question that you or your parents would consider objectionable.

Please complete the information above.

A SECTION Your high school experiences . . .

Please answer every question unless you are asked to skip to another one. You may omit any question that you or your parents would consider objectionable.

BQ1 **1. When do you expect to graduate from high school?**

	(Circle one.)
I will leave high school before I graduate	1
Now through June 1972	2
July or August 1972	3
September 1972 through January 1973	4
February through June 1973	5
After June 1973	6

BQ2 **2. Which of the following best describes your present high school program?**

	(Circle one.)
General	1
Academic or college preparatory	2
Vocational or technical:	
Agricultural occupations	3
Business or office occupations	4
Distributive education	5
Health occupations	6
Home economics occupations	7
Trade or industrial occupations	8

3. How important was each of the following in influencing your choice of your present high school program?

(Circle one number on each line.)

		Not important	Somewhat important	Very important
BQ3A	Your parents	1	2	3
BQ3B	A relative other than your parents	1	2	3
BQ3C	A guidance counselor	1	2	3
BQ3D	A teacher other than a guidance counselor	1	2	3
BQ3E	The principal or assistant principal	1	2	3
BQ3F	Clergyman (minister, priest, rabbi, etc.)	1	2	3
BQ3G	An adult not mentioned above	1	2	3
BQ3H	Friends your own age	1	2	3
BQ3I	Yourself	1	2	3
BQ3J	I had no choice; it was the only program available at my school	1	2	3
BQ3K	I had no choice; I was assigned to it	1	2	3

4. How often has each of the following been used in the courses you are taking this year?

(Circle one number on each line.)

		Never	Seldom	Fairly often	Frequently
BQ4A	Listening to the teacher's lecture	1	2	3	4
BQ4B	Participating in student-centered discussions	1	2	3	4
BQ4C	Working on a project or in a laboratory	1	2	3	4
BQ4D	Writing essays, themes, poetry, or stories	1	2	3	4
BQ4E	Going on field trips	1	2	3	4
BQ4F	Having individualized instruction (small groups or one-to-one with a teacher)	1	2	3	4
BQ4G	Using teaching machines or computer-assisted instruction	1	2	3	4
BQ4H	Watching television lectures	1	2	3	4

BQ5 **5. Which of the following best describes your grades so far in high school?**

(Circle one.)

Mostly A (a numerical average of 90-100)	1
About half A and half B (85-89)	2
Mostly B (80-84)	3
About half B and half C (75-79)	4
Mostly C (70-74)	5
About half C and half D (65-69)	6
Mostly D (60-64)	7
Mostly below D (below 60)	8

6. Have you ever heard of or participated in any of the following high school educational programs?

(Circle one number on each line.)

		Never heard of this program	Have heard of this program but have not participated	Have participated in this program
BQ6A	Cooperative Vocational Education Program (Co-op Program)	1	2	3
BQ6B	High School Vocational Education Work-Study Program	1	2	3
BQ6C	Neighborhood Youth Corps	1	2	3
BQ6D	Talent Search	1	2	3
BQ6E	Upward Bound	1	2	3

BQ7 **7. Approximately what is the average amount of time you spend on homework a week?**

(Circle one.)

No homework is ever assigned	1
I have homework but don't do it	2
Less than 5 hours a week	3
Between 5 and 10 hours a week	4
More than 10 hours a week	5

BQ8 **8. On the average over the school year, how many hours per week do you work in a paid or unpaid job? (Exclude vacations.)**

(Circle one.)

None	0
Less than 6 hours	1
6 to 10 hours	2
11 to 15 hours	3
16 to 20 hours	4
21 to 25 hours	5
26 to 30 hours	6
More than 30 hours	7

9. Do any of the following statements describe your work?

(Circle one number on each line.)

		Yes	No	I do not work
BQ9A	My job is related to my studies	1	2	3
BQ9B	My job leads to work I'd like to do in the future	1	2	3
BQ9C	I work mostly on the weekends	1	2	3
BQ9D	I work mostly during the week	1	2	3

10. Have you participated in any of the following types of activities, either in or out of school this year?

(Circle one number on each line.)

		Have not participated	Have participated actively	Have participated as a leader or officer
BQ10A	Athletic teams, intramurals, letterman's club, sports club	1	2	3
BQ10B	Cheerleaders, pep club, majorettes	1	2	3
BQ10C	Debating, drama, band, chorus	1	2	3
BQ10D	Hobby clubs such as photography, model building, hot rod, electronics, crafts	1	2	3
BQ10E	Honorary clubs such as Beta Club or National Honor Society	1	2	3
BQ10F	School newspaper, magazine, yearbook, annual	1	2	3
BQ10G	School subject matter clubs such as science, history, language, business, art	1	2	3

OPERATION FOLLOW-UP

NATIONAL LONGITUDINAL STUDY OF THE HIGH SCHOOL CLASS OF 1972

First Follow-Up Questionnaire

Form B

Prepared for the
UNITED STATES OFFICE OF EDUCATION
BY RESEARCH TRIANGLE INSTITUTE   RESEARCH TRIANGLE PARK, NORTH CAROLINA
FALL 1973

ORM 2367, 9/73

U.S. Office of Education
Department of Health, Education, & Welfare
Washington, D.C. 20202

Dear OPERATION FOLLOW-UP Participant:

More than a year has passed since you left high school, and the U.S. Office of Education is sponsoring the National Longitudinal Study of the High School Class of 1972. This study, being conducted by the U.S. Bureau of the Census and the Research Triangle Institute of North Carolina, is called OPERATION FOLLOW-UP. It is a nation-wide study which, we expect, will continue over a period of 6 to 8 years and produce valuable and interesting information.

We are asking you to participate in OPERATION FOLLOW-UP. The purpose of this follow-up is to find out what has happened to you and other seniors after leaving high school. The fact that you are working, married, in college or vocational school, or starting a family is important not only to you, but also to educational planners and policymakers. Through your completion of this questionnaire, valuable information can be obtained about a very important part of this country's population--young adults who are going through some of the most significant experiences of their lives.

Please take a little time and fill out this questionnaire. Let us know what you are doing, what you have done since high school, and what you are planning to do in the next year or so. All of the information that you provide will be absolutely confidential; your name will never be published or associated in any way with your individual answers. If there are questions that you would rather not answer, simply do not answer them.

About the questionnaire: you will not need to answer all sections of it. Begin with Section A and follow the instructions for each question. Your answers will guide you to skip parts which don't apply to you. Please follow all these instructions carefully. Most of the questions can be answered simply by circling the number for the response you choose. In some cases, you are asked to write out your answer to a question.

When you complete this questionnaire please return it to us in the enclosed post-paid envelope. We'll be waiting to hear from you.

We will be sending you results from OPERATION FOLLOW-UP in 1974. Watch for our OPERATION FOLLOW-UP Newsletters.

Sincerely,

JA. Davis

P.S. May we have your permission to collect school record information (grades, admission test scores, and program) from your high school? This information, too, will be kept in absolute confidence. Please sign your name below if you give permission.

DIRECTIONS

This questionnaire is divided into the following seven sections:

- A. General Information
- B. Education & Training
- C. Work Experience
- D. Family Status
- E. Military Service
- F. Activities and Opinions
- G. Background Information

Start by answering questions in Section A. You will need to answer the first question in each section, but you may not need to answer all the questions in every section. You may be able to skip most of some sections. We have designed the questionnaire with special instructions in red beside responses which allow you to skip one or more questions. Follow these instructions when they apply to you.

Read carefully each question you answer. It is important that you follow the directions for responding, which are

- **(Circle one.)**
- **(Circle as many as apply.)**
- **(Circle one number on each line.)**

Sometimes you are asked to fill in a blank—in these cases, simply write your response on the line provided. Where you are asked to circle a number, make a heavy circle. Here is an example:

Why did you leave high school?

(Circle one number on each line.)

	My Reasons	**Not My Reasons**
Graduated	[✓ 1]	2
Entered college	1	[✓ 2]
Went to work	[✓ 1]	2

When you complete this questionnaire, please return it to:

Critical Items and Supporting Items in the First and Second Follow-Up Questionnaires

Critical Items and Supporting Items in the First and Second Follow-Up Questionnaires

Each questionnaire was manually edited to insure response to critical items. Critical items were those questions which had to be answered, and in some cases answered consistently in relation to others, before the questionnaire was considered acceptable. Some critical questions are followed by supporting questions which are important non-key items. Some of the critical items, if answered "no," lead to the editing of following supporting items to insure no response to these related questions. However, the same critical items, if answered "yes," indicated necessary editing of supporting questions to make sure they were answered consistently with the "yes."

If there was no response to a critical item, where expected, then follow-up activities were initiated to attempt to obtain this information. A list of critical and supporting items is given on the following page.

Imputation of Grade Point Averages and Conversion of Grading Systems

Imputation of Grade Point Averages and Conversion of Grading Systems

Grade point average information is available for most students. Question 1 from the SRIF solicits information concerning the student's average. The grade averages were reported in a variety of formats based upon a variety of grading systems: letter averages, numerical averages, percentage averages, and other systems. Since this information was provided in a variety of formats, it makes computer processing of information difficult.* In order to facilitate access to this data, a new variable was created, with uniform coding, that provides a grade point average for each student for whom the basic information is present. The codes for this variable are broken into two parts depending upon the source of the data. If a GPA was reported in the SRIF, then the average was coded as 1-14 to represent A+ through below F. If the GPA was not reported, then the GPA was estimated from the percentile rank and coded 15-28; and for some students neither GPA nor percentile rank were available. These codes are as follows:

Estimated GPA	GPA Reported in SRIF	GPA Estimated from Percentile Rank
A+	1	15
A	2	16
A-	3	17
B+	4	18
B	5	19
B-	6	20
C+	7	21
C	8	22
C-	9	23
D+	10	24
D	11	25
D-	12	26
F	13	27
Below F	14	28

---

*In the SRIF field that contains the GPA both alphabetic and numeric data are present (e.g., A+ or 95 or 5 depending upon grading system).

The letter grades were derived from the relationships displayed in Table 3 of the manual. This grade conversion system is described in detail by Breland (1973)* and Pinchak and Breland (1973).**

The inclusion of this variable is simply an alternative source of GPA information and does not imply that alternative methods of obtaining conversions from one grading system to another should not be attempted or that other means of estimating GPA should not be attempted. The basic information is present in the SRIF and can be used to generate other estimation procedures or conversion systems.

Appendix J

Frequency Distributions for Base-Year, First Follow-Up, and Second Follow-Up Questionnaire Items

Frequency Distributions for Base-Year, First Follow-Up, and Second Follow-Up Questionnaire Items

This appendix presents a complete and detailed listing of the variables and variable frequency distributions in the data file. For each variable in the file, the variable number, a short variable label, the tape location, a longer variable title, and a completely labeled frequency distribution (for all categorical codes that occur for that variable) are presented. For several items individual code tabulations would not be appropriate; in these cases group frequencies are reported, or only the frequency of data within the minimum to maximum range of the item and the error codes for the item are given. The fields that contain alpha-numeric information are documented as such in the frequency distributions.

As an aid in interpreting the labeling and coding methods used in these frequency distributions, consider the following hypothetical item response diagram:

0,1,2	8	Datum $\begin{pmatrix} +20, \\ +40, \\ +60 \end{pmatrix}$

The outermost digit in this response diagram indicates the level of routing consistency. A "0" denotes consistency; a "1," inconsistency; or a "2," multiple inconsistencies with the routing item or items external to it. For all variables, any value label containing an asterisk (*) denotes external routing inconsistency.

Within the datum for routing items, there may possibly exist codes to which have been added either 20, 40, or 60, indicating a violation of the logic of the skip pattern. A value label containing "X," "XX," or "XXX" denotes the addition of 20, 40, or 60, respectively.

For those manually edited items with initial multiple responses, a prefix of "8" has been added to the response. This digit, which indicates editing, precedes the datum.

For some variables, response values were collapsed for presentation purposes due to the large number of possible responses. This collapsing is indicated in frequency distributions by category labels specifying defined ranges. Consider the two sample tables presented below.

In Sample Table J.1, individual code tabulations are reported. The values in the "CODE" column actually exist on the data file. The category labels for these values correspond to the item response descriptions for second follow-up question 4 (SQ4).

In other cases, where data have been collapsed for reporting, the value in the "CODE" column is arbitrary and has been deleted. Sample Table J.2 illustrates the collapsing procedure. Group frequencies are reported for the ranges indicated by the category labels. It must be noted that no values are presented in the "CODE" column. This is the result of temporarily collapsing the ranges for printing, and the full range of values is present on the data file. The distribution presented in Table J.2 indicates that the possible range of values is 0 to 299999. Reference to the questionnaire item being summarized will aid in definition of what exact values can be expected in the data file for continuous variables.

In this appendix, the tabulations of the variables are listed in the order that the variables appear in the data file.

Subject Keyword Index

HOW TO USE THIS INDEX

Entries in the keyword index appear in the following format, where each line represents a variable name and in most cases is a complete survey question item or response option:

```
HELD AN OFFICE OR BEEN  ELECTED TO,  GOVERNMENT JOB,   POLIT  1376 SQ136H
WHILE TO VOTE IN LOCAL  ELECTIONS,  POLITICAL OPINIONS/WORT  1349 SQ134A
 MOTHER WORK BEFORE IN  ELEMENTARY SCHOOL,                    863 FQ80C
 WORK WHEN YOU WERE IN  ELEMENTARY SCHOOL,             MOTHER  862 FQ80B
                FAMILY  EMERGENCY/REASON FOR WITHDRAWING,      653 FQ38C
SCHOOL SHOULD PUT MORE  EMPHASIS VOCATIONAL/TECHNICAL,  PROG   165 BQ19D
E H-S,   SCHOOL SHOULD  EMPHASIZE BASIC ACADEMIC SUBJECTS/AG   162 BQ19A
 /JOB,        WERE YOU  EMPLOYED DURING THE MONTH OF SEPT-74  1241 SQ100A
          WHAT TYPE OF  EMPLOYEE /JOB/OCCUPATION,             1154 SQ76E
```

Each variable name is alphabetically arranged according to the keyword (i.e., index term) following the first double space in each line. Parts of the complete line text may be cut off, but enough of it is shown to place the index term in context. The shifting or permuting of each line, so that each significant index term is shown as a keyword, is controlled by a computer program, and one variable will appear as many times as there are significant words in its name.

To locate variables relating to some particular research interest, the user enters the index with words indicative of the desired content, or which he believes are significant and would be used in questionnaire items in NLS. A glance to the left and right of the keyword will indicate the context in which the word is used. When the variable name or response option itself did not contain enough meaningful words to index on, editors inserted additional terms marked off by slashes (/).

The number at the end of each line identifies the file location, questionnaire identity, and item number of the variable. The first four digits (right justified) are the sequential variable numbers in the file; up to seven remaining characters constitute the short label for the variable and can be easily decoded, e.g.:

BQ = Base-Year Questionnaire
FQ = First Follow-Up Questionnaire
SQ = Second Follow-Up Questionnaire.

In cases where the short variable label exceeds seven characters, the right-most characters have been truncated.

Specification and Use of Planning and Activity State Variables[1]

---

[1] The design and specification of the activity states were prepared by Samuel Peng, George Dunteman, and Mary Margaret Holt; this documentation is taken from their original specifications.

Specification and Use of Planning and Activity State Variables

I. INTRODUCTION

One planning state variable and 16 activity state variables are included for the base-year and first follow-up data. The activity states for 1972 and 1973 have been updated with information gleaned from the activity state survey that took place concurrently with second follow-up operations. Additionally, eight activity states have been developed for 1974 using information from the Second Follow-Up Questionnaire. These variables are specially created for facilitating any analysis involving postsecondary activity status. Most of these variables are created by pooling information together from various items. The specific procedures are described in the following sections. Also described in this appendix are procedures used to impute or resolve missing data, and methods for using the planning and activity state variables to generate activity-state classifications.

While this document provides sufficient information to use the planning and activity state variables, one caution on their use is required. Most activity state variables should not be used independently in estimating proportions. For example, if one is interested in knowing the proportion of students in various types of postsecondary education in October 1972, one should use the variable ACT272 (what school?) and cross it by the variable ACT172 (study?) to get conditional proportions. The design and definition of the activity states is such that they provide great flexibility. The price of this flexibility is that the states must be combined to provide specific categories of status.

II. SPECIFICATION OF PLANNING AND ACTIVITY STATE VARIABLES

Because of the complex skip patterns in the First Follow-Up Questionnaire, some activity state variables were recoded to reflect the conditional nature of the item responses. Some imputations were carried out during the recoding process while other imputations were carried out subsequent to the recoding phase. The variable list and recoding process are presented below.

II.1 Specification of Planning States in Spring 1972 (PLAN72)

1. VOTECH (vocational or technical student)--response of 5 to base-year Student Questionnaire (BYQ)* 31, and response of 1, 2, or 3 to BYQ.55.
2. 2YR COLL (two-year college study)--response of 6 or 7 to BYQ.31, and response of 1, 2, or 3 to BYQ.65.
3. 4YR COLL (four-year college study)--response of 8 to BYQ.31, and response of 1, 2, or 3 to BYQ.65.
4. WRK FULL (working full-time)--response of 1 to BYQ.31, and response of 1, 2, or 3 to BYQ.32.
5. WRK PART (working part-time only)--response of 9 to BYQ.31, and response of 1, 2, or 3 to BYQ.77.
6. ONJOB TR (on-job training program)--response of 2 to BYQ.31, and response of 1, 2, or 3 to BYQ.38.
7. MILITARY (military service)--response of 3 to BYQ.31, and response of 1, 2, or 3 to BYQ.43.
8. HOMEFULL (full-time homemaker)--response of 4 to BYQ.31, and response of 1, 2, or 3 to BYQ.50.
9. OTHER (travel, etc.)--response of 10 to BYQ.31.
10. NON-RESP (no short-term plans)--no response to BYQ.31, or beginning date of any plan is January 1973 or later.
11. NO BYR (no base-year Student Questionnaire).

---

*BYQ is the abbreviation for the base-year Student Questionnaire.

II.2 Recoding Follow-Up Question No. 23**

2 = Not Studying--response of 2 to first follow-up question (FFQ)*** 23; response of 93-98 to FFQ.23, but at least one response of 1 to FFQ.24.

All other codes are not used, and are thus unchanged.

II.3 Specification of Activity State Variables in October of 1972

A. ACT172 (Study?)

1. YES--response of 1 to FFQ.29a; missing to FFQ.29a and "no" response of any 1 or blank to FFQ.29b but non-blank to FFQs.30, 33b, or 33c.

2. NO--respose of 2 to FFQ.29a; missing to FFQ.29a, and at least two responses of 1 to FFQ.29b, but blank to FFQs.30, 33b, and 33c; response of 2 to FFQ.23.

3. UNCLASS (unclassifiable)--the remaining students who did not provide any relevant information.

4. NO FFU (no First Follow-Up Questionnaire).

B. ACT272 (What school?)

1. VOTECH (vocational-technical)--response of 1 to FFQ.32b or FFQ.26b, if ACT172 = 1.

2. 2YR COLL (two-year college)--response of 2 to FFQ.32b or FFQ.26b, if ACT172 = 1.

3. 4YR COLL (four-year college)--response of 3 to FFQ.32b or FFQ.26b, if ACT172 = 1.

4. OTHER (bible school, etc.)--response of 4 to FFQ.32b or FFQ.26b, if ACT172 = 1.

5. UNCLASS (unknown or not studying)--the remaining students.

6. NO FFU (no First Follow-Up Questionnaire).

C. ACT372 (Full-time study?)

1. ST FULL (study full-time)--response of 1 to FFQ.33b; missing to FFQ.33b but 12 or greater to FFQ.33c.

**This specification is needed for the creation of ACT172 and ACT173.

***FFQ is the abbreviation for the First Follow-Up Questionnaire.

871

2. ST PART (study part-time)--response of 2 to FFQ.33b; missing to FFQ.33b but less than 12 and greater than 0 to FFQ.33c.

3. UNCLASS (unknown or not studying)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

11. IMP FULL (imputed full-time studying).

D. ACT472 (Work?)

1. YES--response of 1 or 2 to FFQ.54a; missing to FFQ.54a but non-blank to occupation code for FFQ.55.

2. NO--response of 3 to FFQ.54a; missing to FFQ.54a but at least one response of 1 to any item in FFQ.54b.

3. UNCLASS (unclassifiable)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionniare).

E. ACT572 (Full-time work?)

1. WRK FULL (work full-time)--35 or greater to FFQ.56a.

2. WRK PART (work part-time)--less than 35 but not blank to FFU.56a.

3. UNCLASS (unclassifiable or not working)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

11. IMP FULL (imputed full-time working).

12. IMP PART (imputed part-time working).

F. ACT672 (Homemaker?)

1. YES--response of 1 to "was full-time homemaker" in FFQ.54bc.

2. NO--response of 2 to "was full-time homemaker" in FFQ.54bc.

3. UNCLASS (unknown or not homemaker)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

G. ACT772 (Looking for work?)

1. YES--response of 1 to FFQ.54c.
2. NO--response of 2 to FFQ.54c.
3. UNCLASS (unknown or not looking for work)--the remaining respondents.
4. NO FFU (no First Follow-Up Questionnaire).

H. ACT872 (Military Service?)

1. YES--response of 3 to FFQ.64, and response of October 1972 or before to FFQ.67, and response of after October 1972 or response of 2 to FFQ.74.
2. NO--response of 1 or 2 to FFQ.64.
3. UNCLASS (unclassifiable)--the remaining students.
4. NO FFU (no First Follow-Up Questionnaire).

II.4 Specification of Activity States in October 1973

I. ACT173 (Study?)

1. YES--response of 2 to FFQ.25; missing to FFQ.25 but 1, 2, 3, or 4 to FFQ.26b and 1 or 2 to FFQ.26c.
2. NO--response of 1 to FFQ.25; missing to FFQ.25 but blank to FFQ.26b and FFQ.26c; response of 2 to FFQ.23.
3. UNCLASS (unclassifiable)--the remaining respondents who did not provide any relevant information.
4. NO FFU (no First Follow-Up Questionnaire).

J. ACT273 (What school?)

1. VOTECH (vocational-technical)--response of 1 to FFQ.26b.
2. 2YR COLL (two-year college)--response of 2 to FFQ.26b.
3. 4YR COLL (four-year college)--response of 3 to FFQ.26b.
4. OTHER (bible school, etc.)--response of 4 to FFQ.26b.

5. UNCLASS (unclassifiable or not studying)--the remaining respondents.

6. NO FFU (no First Follow-Up Questionnaire).

K. ACT373 (Full-time study?)

1. ST FULL (study full-time)--response of 1 to FFQ.27b; missing to FFQ.26b but 12 or greater in response to FFQ.27c.

2. ST PART (study part-time)--response of 2 to FFQ.27b; missing to FFQ.26b but less than 12 but not blank to FFQ.27c.

3. UNCLASS (unknown or not studying)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire)

11. IMP FULL (imputed full-time studying).

L. ACT473 (Work?)

1. YES--response of 1 to FFQ.48a; missing to FFQ.48a but a code to FFQ.49a-e.

2. NO--response of 2 to FFQ.48a; missing to FFQ.48a and at least one response of 1 to any item to FFQ.48b.

3. UNCLASS (unknown or not working)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

M. ACT573 (Full-time work?)

1. WRK FULL (work full-time)--35 or greater in response to FFQ.50a.

2. WRK PART (work part-time)--less than 35 but not blank to FFQ.50a.

3. UNCLASS (unknown or not working)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

11. IMP FULL (imputed full-time working).

12. IMP PART (imputed part-time working).

N. ACT673 (Homemaker?)

1. YES--response of 1 to "was full-time homemaker" in FFQ.48bc.

2. NO--response of 2 to "was full-time homemaker" in FFQ.48bc.

3. UNCLASS (unknown or not homemaker)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

O. ACT773 (Looking for work?)

1. YES--response of 1 to FFQ.48c.

2. NO--response of 2 to FFQ.48c.

3. UNCLASS (unknown or not looking for work)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

P. ACT873 (Military Service?)

1. YES--response of 3 to FFQ.64, and response of October 1973 or before to FFQ.67, and response of after October 1973, or response of 2 to FFQ.74.

2. NO--response of 1 or 2 to FFQ.64.

3. UNCLASS (unclassifiable)--the remaining respondents.

4. NO FFU (no First Follow-Up Questionnaire).

II.5 Specification of Activity States in October 1974[*]

Q. ACT174 (Study?)

1. YES--SQ.10[**] = 2 or (SQ.10 = 94 and SQ.12 = 2 and SQ.16 = 2).

2. NO--SQ.10 = 1 or SQ.10 = 97 or SQ.10 = 99 or (SQ.10 = 98 and SQ.9 = 1).

3. UNKNOWN--no valid information.

4. Nonparticipant in SFU.

---

[*] Note: all item flags were disregarded in computing these activity states; that is, item flags (20, 40, 60 codes) were removed prior to computations.

[**] SQ is the abbreviation for the Second Follow-Up Questionnaire.

875

R. ACT274 (What school?)

1. VOCTECH--response of 1 to SQ.12.
2. TWO-YEAR COLLEGE--response of 2 to SQ.12.
3. FOUR-YEAR COLLEGE--response of 3 to SQ.12.
4. OTHER--response of 4, 5, 6, or 7 to SQ.12.
5. UNKNOWN--response of other than 1 through 7 to SQ.16 and not a SFU nonparticipant.
6. Nonparticipant in SFU.

S. ACT374 (Full-time study?)

1. YES--response of 1 to SQ.16.
2. NO--response of 2 to SQ.16.
3. UNKNOWN--response other than 1 or 2 to SQ.16 and not a SFU nonparticipant.
4. Nonparticipant in SFU.

T. ACT474 (Work?)

1. YES--response of 2 or 3 to SQ.75.
2. NO--SQ.75 = 1 or ((SQ.75 = 94 or SQ.75 = 98) and (SQ.74 = 1)) or SQ.75 = 99.
3. UNKNOWN--no valid information.
4. Nonparticipant in SFU.

U. ACT574 (Full-time work?)

1. YES--response of 2 to SQ.75.
2. NO--response to 3 to SQ.75.
3. UNKNOWN--response other than 2 or 3 to SQ.75 and not a SFU nonparticipant.
4. Nonparticipant in SFU.

V. ACT674 (Homemaker?)

1. YES--response of 5 to SQ.1E.
2. NO--response of 99 to SQ.1E.
3. UNKNOWN--response other than 5 or 99 to SQ.1E and not a SFU nonparticipant.
4. Nonparticipant in SFU.

W. ACT774 (Looking for work?)

1. YES--response of 6 to SQ.1F.
2. NO--response of 99 to SQ.1F.
3. UNKNOWN--response other than 6 or 99 to SQ.1F and not a SFU nonparticipant.
4. Nonparticipant in SFU.

X. ACT874 (Military Service?)

1. YES--response of 4 to SQ.1D.
2. NO--response of 99 to SQ.1D.
3. UNKNOWN--not a response of 4 or 99 to SQ.1D, and not a SFU nonparticpant.
4. Nonparticipant in SFU.

III. MISSING DATA RESOLUTION

As expected, some NLS participants failed to respond to certain variables used to define planning and activity states. The problem of missing data is usually resolved by special procedures such as imputation, statistical adjustment, and further data collection. While some procedures for imputing missing data for activity state variables were incorporated in the steps of defining and recoding variables as specified in the preceding section, two further phases of imputation procedures were implemented. The first phase involved direct logical inferences (e.g., types of school from name and address of school); and the second phase involved indirect logical inferences (e.g., impute studying full-time for those whose study time is unknown but who are studying and not working). The imputation procedures are described below.

III.1 Direct Logical Inferences

A. Type of school (October 1972 and 1973)
    1. The name and address of school were listed for those respondents who were in school but did not indicate type of school or indicated "other" type of school for either October 1972 or October 1973. There were 1,034 such cases for October 1972 and/or October 1973.
    2. The respondents on this list were classified in regard to type of school, and "others" were reclassified if necessary.

B. Study status (October 1972)
    1. The date of entering postsecondary institution was listed for those respondents who failed to indicate whether they were in school in October 1972.
    2. The respondents on this list were classified in regard to study status in October 1972. There were only four such cases.

III.2 Indirect Logical Inferences

A. Work full-time versus work part-time (October 1973 and/or October 1973)

1. The occupation code and weekly income were listed for working respondents who did not indicate hours worked per week for either October 1972 or October 1973.
2. Frequency distributions involving 13 income categories were run separately for part-time and full-time working respondents for October 1972. The procedure was repeated for October 1973. These runs were needed to devise decision rules for allocating respondents to full-versus part-time work on the basis of income.
3. The listed respondents were appropriately allocated to full- or part-time work for the October(s) in question on the basis of the relative likelihood of this income being generated from full- or part-time work.
4. There were 177 cases to resolve for October 1972 and 107 for October 1973.
5. For both October 1972 and 1973, working full-time was imputed for those respondents who specified not studying and specified working (but not full- or part-time). There were 670 such respondents for October 1972 and 689 for October 1973. Based upon data from the classifiables, this rule yielded a probability of .84 for correctly classifying a respondent in respect to full- versus part-time work.

B. Study full-time versus study part-time (October 1972 and 1973)

1. For both October 1972 and October 1973, studying full-time was imputed for those respondents who specified study (but not full- or part-time) and specified not working. This rule involved 348 respondents for October 1972 and 342 for October 1973. Based upon data from classifiables, this rule

resulted in a probability of .98 for correctly classifying a respondent in respect to full- versus part-time study.

2. For both October 1972 and October 1973, studying full-time was imputed for those respondents who specified study (but not full- or part-time) and specified working part-time. This rule involved 41 respondents for October 1972 and 94 for October 1973. Based upon data from classifiables, this rule resulted in a probability of .94 for correctly classifying a respondent in respect to full- versus part-time study.

C. Study Status - October 1974 (ACT174)

In certain cases, where information was absent or contradictory, imputations were made. If

(a) SQ.10 = 98 and (SQ.9 = 98 or SQ.9 = 2)

(b) SQ.10 = 2 and (SQ.9 = 1),

then second follow-up questions 1B, 1C, 11, 12, 14, 15, 16, and 17 were examined to attempt to determine ACT174 status. In this process 45 cases were imputed.

D. Type of School - October 1974 (ACT274)

In a similar fashion as with ACT174 imputations were made for type of school. If SQ.2 had a response of 2 and SQ.12 had a response of 5, 6, 7, 96, or 98, then second follow-up questions 1B, 1C, and 11 were examined for evidence of type of school. In this process 123 imputations were made.

E. Full-Time or Part-Time Study Status - October 1974 (ACT374)

Again, where answers to the basic questions for this activity state were ambiguous or missing, supporting evidence was sought from other second follow-up items. If the response to SQ.10 was 2 and the response to SQ.16 was 3, 96, 97, or 98, then SQ.17 was examined. If more than 12 hours of class time was reported on SQ.17, then full-time study was imputed. If less than 12 hours was reported, then part-time study was imputed. In all, 102 items were imputed.

F. Work Status (ACT474) and Part-Time/Full-Time Work (ACT574) - October 1974

If the response of SQ.75 was ~~94~~, 96, 97, or 98 and the response to SQ.74 was 2, 94, 97, or 98, then second follow-up questions 76, 77, and 78 were examined to attempt to ascertain work status and full-time/part-time status (≥35 hours per week was considered full-time (Q.77)). In this process 44 cases were imputed.

III.3 Number of Cases with Missing Data

After the preceding imputation process, there were still some cases with missing data. The extent of missing data is summarized in Table M.2. No attempt was made to impute variables such as homemaker, looking for work, and military service. The major reasons for not conducting any further imputation in these three areas were that only a relatively small number of sample members were in these categories, and no reasonable imputation rules could be defined to impute values for these variables.

Table M.2

NUMBER OF MISSING CASES

Sample N = 21,350 FFU Respondents
20,872 SFU Respondents

	1972	1973	1974
Study Status (ACT1)	59	2	0
School--Type (ACT2)	131	47	33
School--Time (ACT3)	65	260	48
Work Status (ACT4)	32	20	0
Work--Time (ACT5)	91	129	5

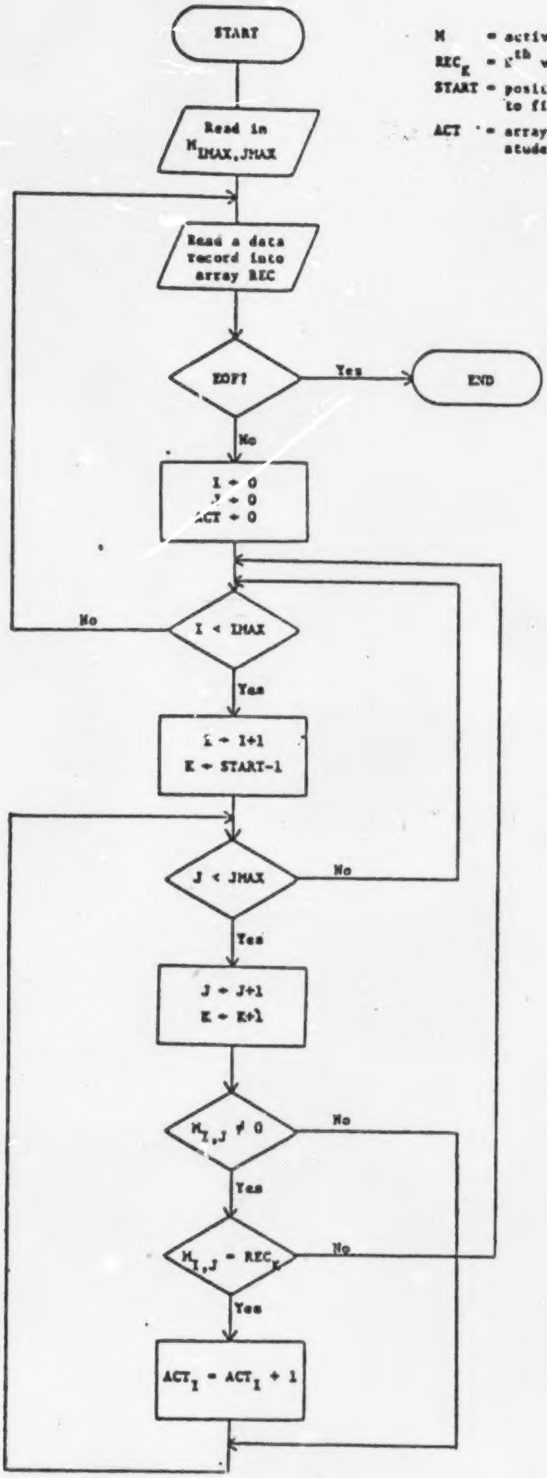
IV. SUGGESTED ANALYSIS APPROACH AND VECTOR CLASSIFICATION SCHEME

Plans in the spring of 1972 are mutually exclusive categories, and they are indicated by ten codes. This planning variable is a fixed variable that provides no flexibility in definition except for grouping the ten categories into broader categories such as study, work, and other. The activity variables are, however, rather flexible. Different combinations of codes from several variables can generate different activity states. For example, if a researcher wants to identify a group of individuals who were studying full-time in a four-year college in October 1972, he simply needs to get the following combination of codes from the appropriate variables (A is study status, B is type of school, C is amount of study time for October 1972 as defined in Section II).

Variable	A	B	C	D	E	F	G	H
Code	1	3	1	0	0	0	0	0

In a sense, activity state classification is a recoding procedure that uses relevant activity variables. This recoding may be accomplished for some computer programs by using logical statements. For example, using the SPSS program, the above activity state (i.e., studying full-time in a four-year college) may be generated by the following variable transformation statement: If (A EQ 1 AND B EQ 3 AND C EQ 1), VAR 1 = 1.

It is easily seen that such a recoding process is cumbersome. A long list of "If" statements is needed if a dozen different activity states need to be defined. A researcher may develop a program in which the input setup is simplified through the use of vectors or matrices of codes. A program flowchart is suggested in Figure M.1 on the following page. This type of input scheme is flexible, since it allows the definition and examination of different classification schemes with little change in the input setup. This type of input setup is illustrated with the following two examples of different activity state classification schemes. A vector of certain numbers can be used to define any one particular activity state, and a matrix of numbers can be used to define a complete set of activity states such as those sets shown in Tables M.3 and M.4.



M = activity state input matrix

REC_K = K^{th} variable of student's record

START = position in REC which corresponds to first column variable in M

ACT = array for storing number of students in each activity state

With the input vectors as shown in the tables, the program will assign each member into one of the newly defined categories. To change any one activity state definition, one simply needs to change one of the row vectors. For example, if a researcher is interested in study and work states in October 1972 regardless of the type of school and part-time versus full-time status, he may simply specify these two groups with the following two-row vectors.

A	B	C	D	E	F	G	H
1	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0

It should also be noted that such a scheme allows mutually exclusive activity state categories as well as nonmutually exclusive ones. For example, the study only and the work only groups as specified in Table M.3 are mutually exclusive groups, whereas the study and the work groups in the example above are not.

Response Rates by Sample Status of School

Response Rates by Sample Status of School

The survey effort involved in the NLS was complicated by significant amounts of school nonresponse in the base-year survey. The original sampling frame called for 1,200 schools, i.e., 600 strata with two schools per stratum. In the base-year operations, only 948 primary schools were able to participate (school participation being defined as students from the school contributing one or more test batteries, SRIF's, or Student Questionnaires). Substitutions were made, in the base year, for nonparticipating schools by employing backup schools. A total of 122 substitution schools were employed, and of these schools, 26 proved to be redundant substitutions since the stratum already contained two primary schools. Table N.1 summarizes these data. At the close of the base-year survey operations, only 1,044[*] of a targeted 1,200 schools had participated. At this point there remained several strata with no participating schools and many more with only one school per strata. In order to complete the targeted sample, a resurvey effort was planned and implemented as part of the first follow-up survey. In this effort an attempt was made to elicit cooperation from the nonparticipating base-year primary schools and to obtain replacement to fill empty or partially filled strata utilizing backup schools if necessary. Additionally, 16 new schools were added to the sample (strata 601-608) as part of an effort to augment the original sample. These new schools are labeled augmentation schools. The extent of this new survey effort (the resurvey) is also displayed in Table N.1. At the end of the first follow-up survey the resurvey effort resulted in 1,326 schools participating in the study. In the base year there were 26 strata that contained an extra school in their stratum as well as many empty or partially filled strata. At the end of the first follow-up, there were no empty or partially filled strata but 101 strata with extra schools in the stratum.

[*] This figure ignores the extra schools and considers the procedure of substitution as legitimately replacing primary schools.

SAMPLE AND SURVEY STATUS OF THE NLS SCHOOLS

	Survey Status		
Sample Status	Base Year Survey First Participated in Base Year	Resurvey- First Participated in First Follow-Up	Total
Primary	948	205	1,153
Backup	96[1/]	35	131
Extra	26[2/]	0	26
Augmentation	0	16	16

[1/] One of the backup schools was added after the close of base year operations but prior to the resurvey effort. It was the third school in its stratum and hence extra.

[2/] Only 18 of 26 extra schools were retained in the final data base.

Given the complex nature of data collection and the resultant problem of both unfilled strata and redundant schools in strata, it is rather difficult to compute an unequivocal response rate for students. First, it was necessary to determine exactly which sample schools and students were to be considered "in sample" cases for the 1972 NLS project. As indicated, the sample design involved 1,200 primary sample schools (two per final stratum) and a planned total of 21,600 students (18 per school). However, the use of backup schools in the base-year and first follow-up surveys, plus the resurvey work to obtain responses from all of the primary sample schools, resulted in three or four schools being represented in many final strata. After considering the alternatives, it was decided that all sample schools from which any Student Questionnaires were completed (TB, SRIF, BSYR, or FFU) in either the base-year or first follow-up survey, would be considered to be in the NLS sample. A total of 1,339 schools were classified as "in the final NLS sample"--1,153 participating primary sample schools, 21 primary sample schools with no 1972 seniors, 131 backup sample schools, 18 "extra" base-year schools in which Student Questionnaires were completed, and 16 augmentation sample schools. It would have been possible to reduce the sample of schools to the 1,200 originally intended, but this alternative was not exercised since considerable base-year student data would have been discarded.

Given this decision, calculation of response rates for the various instruments becomes more straightforward. The denominator of the rate becomes the number of students sampled and eligible, and the numerator is the number of instruments returned. Table N.2 presents the number of students sampled and the number of instruments returned for the various categories of schools and for each period of survey operations. The table lists eight categories of schools. These categories depend upon the point at which the school entered the survey (base year or resurvey) and whether or not there was redundant sampling within a stratum (i.e., more than two schools per stratum). This table allows selection of a subset of schools that meet the requirements of the original 1,200 school sampling frame. It is done by eliminating redundant schools within a stratum (rows 3, 5, and 7) and ignoring the augmentation schools. This

[1] One backup school (11 students) was moved to row 7; this school was added between the base year and and resurvey operations and was extra or redundant in its stratum.

[2] Eight of the 26 extra schools have been dropped from the NLS sample. No student data was collected from the dropped schools in any of the survey periods.

[3] Only 329 students come from the 18 extra schools retained in the sample.

[4] No instruments were mailed in the first follow-up to students from extra schools.

[5] The final NLS sample contains 23,451 students after eliminating the students from the 8 extra schools that were dropped.

[6] In cases where too many resurvey schools were added to fill a strata (e.g., 2 resurvey schools added to a stratum with 1 base year school) a random selection was made to label one of the added schools as redundant. The schools selected were as follows: 5830, 9167, 9090, 6784, 7538, 4924, 3262, 3900, 6470, 8693.

selection process considers the base-year primary schools and base-year backup schools (rows 1 and 2) to be part of the 1,200 originally targeted sample of 1,200 schools. It then allows into the frame only those resurvey schools that filled a strata that was missing one or two schools in the base year. Hence, only resurvey schools, either primary or backup (rows 4 and 6), that filled up a stratum are counted. The remaining schools are considered as extra schools, extra either in the base year or in the first follow-up. The body of the table indicates the number of students sampled within each category of school and the number of returned instruments at each point in the survey.

The first half of Table N.3 depicts the return rates of the three Student Questionnaires with respect to the original 1,200 school sampling frame. In order to calculate these figures, only those schools that were originally targeted or nonredundantly substituted for are considered. That is, rows 3, 5, 7, and 8 from Table N.2 were omitted from the calculations. The return rates for both considerations of the sample are similar and reflect good response rates except for the base year in which there was considerable scheduling difficulty with the targeted schools.
